Title : Energy Spectrum of Negative Pions, Formed by Cosmic Rays  
in a Photo Emulsion.

Orig Pub : Zh. eksperim. i teor. fiziki, 1956, 30, No 6, 1164-1166.

Abstract : The authors give the energy spectra obtained for 195 positive and 328 negative pions, generated in the R-5 emulsion (emulsions 330 and 450 microns thick, 10 cm in diameter), exposed to cosmic rays in the stratosphere. Corrections are made to the obtained data to take into account the finite dimensions of the emulsion blocks.. The author believes it possible that in the negative pion spectrum, in the range of 10 -- 30 Mev, there is a small maximum which in their opinion can be interpreted as the decay of  $\Delta^0$

Card 1/2

USSR/Nuclear Physics - Elementary Particles.

C-3

Abs Jour : Ref Zhur - Fizika, No 4, 1957, 8641

particles, absorbed by the same nucleus. The shift in the position of the maximum can be explained by the fact that the  $\Lambda^0$  particle may turn out to be a lower energy level than the least bound neutron, and also by the slowing down of the negative pion in the Coulomb field of the nucleus.

Title : Disintegration of Beryllium and Carbon Nuclei as a Result of  $\pi^-$ -Meson Capture.

Orig Pub : Zh. eksperim. i teor. fiziki, 1956, 30, No 6, 1166-1167.

Abstract : Seven cases were observed of the absorption of  $\pi^-$ -mesons in microcrystals of beryllium and 12 cases of absorption in microcrystals of carbon, introduced into the photographic emulsion. The characteristic feature of the above  $\pi^-$ -stars is the absence of tritons with energies greater than 10 Mev, and the fact that the mean energy of the emitted protons does not exceed 10 Mev. In the author's opinion, the above data are evidence that in the primary act a greater portion of the rest energy of the  $\pi^-$ -meson is received by 1 -- 2 neutrons which do not experience secondary collisions in such light nuclei, as beryllium and carbon.

A Possible Example for the Anomalous Decay of a Hyperfragment.

Dokl. Akad. Nauk, 110, fasc. 5, 758-760 (1956)

Issued: 12 / 1956

A packet of 56 emulsion layers of  $330 \mu$  thickness each, which was irradiated in the stratosphere, was used for the purpose of studying unstable particles. One of the secondary stars found was ascribed to an unstable fragment decaying with an abnormally low emission of energy. The primary star was of the type  $18 + 4n$  and it emitted a particle which decayed after passing through  $39 \mu$  and emitting two charged particles b and c. Both came to a standstill in the emulsion after 15,5 mm and  $4,5 \mu$  respectively. The traces of a, b and c were complanar up to  $2^{\circ}$ . The charge of the particle a was  $z_a < 3$  and probably even  $z_a < 1$ . However, at least the mass of the particle a was probably larger than that of the proton. The trace of b originated from a negative pion which had come to a stop in the emulsion. Taking account of a possible straggling its energy is assumed to be  $29,4 + 1,2$  MeV. In the case investigated here it is impossible that a  $\Sigma$ -hyperon is concerned. It follows from the shortness of the trace that spallation may be caused by the capture of a  $\Sigma$ -hyperon by a light nucleus of the type C, N, O, but not by a heavy nucleus like Ag and Br. The process investigated is apparently the decay of an instable fragment associated to a  $\Lambda^0$ -particle. No decay scheme with the creation of two particles

Dokl.Akad.Nauk,110,fasc.5, 758-760 (1956) CARD 2 / 2

PA - 1668

agrees with the experimental results. Among the analyzed schemes with creation of three particles the following come into question:

At present about 100 acts of decay of hyperfragments are known. If the schemes (1) or (2) are recognized as valid the case investigated here might correspond to a relative probability of the radiation decay of the hyperfragment of  $\sim 1\%$ . Apparently the creation mechanism of the  $\gamma$ -quantum can, in the case under investigation, be the same as on the occasion of the anomalous  $\pi - \mu^-$  decay with a short range of the emitted myons and as in the case of the radiation decay of a  $\tau$ -meson with the decay scheme  $\tau \rightarrow 3\pi + \gamma$  (this is the case all the more as, according to T. EGUCHI, Phys. Rev. 85, 943 (1952), and other works, the probability of the radiation decay of the fragment and also the probability of the reactions  $\pi \rightarrow \mu + e + \gamma$ ,  $\tau \rightarrow 2\pi + \gamma$  and  $K \rightarrow \mu + V + \gamma$  are near 1%). Of the remaining rays of the primary ray 20 traces belong to stable particles and 2 traces do not end in the emulsion packet.

ABSTRACT

In connection with the systematic investigation of electron-photon showers occurring in the nuclear emulsion layers in the stratosphere an unusual formation of showers was recorded. A 150 - layer plate of the emulsion "P" was used as photoplate. The thickness of a layer was about  $400 \mu$  and the plates had a diameter of 10 cm.

Exposure was carried out for about 10 hours in an altitude of about 20 - 24 km. The density of orbital traces in the emulsion was 37 grains per  $100 \mu$  in the case of a minimum of ionization.

The unusual shower was caused by single electrons the path of which in the individual layers of the emulsion was  $\sim 0,5$  cm.

21 secondary electron-positron pairs were found, of which 12 had an energy of  $\sim 10$  eV.

An exact analysis of these traces allows the conclusion that the primary electrons causing the effect had an energy of from  $0,6$  to  $2 \cdot 10^{18}$  eV.

Card 1/2

56-5-5/55

Multiple Electron Production in a High Energy Electron-Photon Shower

As a particular feature when analyzing the traces it was found that 6 electron-positron pairs always in couples occurred and must therefore also have been formed simultaneously.

"ELECTRON-PHOTON CASCADES WITH ENERGIES FROM  $10^{11}$  TO  $10^{-13}$  ev IN NUCLEAR EMULSIONS"  
R.I. Gerasimova, A.A. Varfolomeyev, I.I. Gurevich, L.A. Makaryina, A.S. Romantseva,  
S.A. Chuyeva

Fifteen electron-photon cascades with energies from  $10^{11}$  to  $10^{-13}$  ev, recorded in six emulsion stacks with a total volume of  $10^1$ , have been investigated.

The energies of the primary photons evoking the cascades were determined by the energy spectrum of the cascade electrons at a depth of  $2.5 \pm 3t_0$  ( $t_0$  - rad. unit).

The grain density and the gap density were measured for the first pairs. In all the pairs with energies  $3 \times 10^{11}$  ev, a decrease in grain density at the apes caused by the screening effect was discovered.

The following experimental relation of the ionization losses of pair (1) was obtained:

where  $I_{pe}$  is the specific ionization electron loss at the ionization plateau,  $x$  is the distance from the apes of the pair in cm, and  $E$ , is the energy of the photon which produced the pair.

The expression obtained for  $I/21pe$  may be used to determine the  $E$  energy from experimental values for  $I$ . An estimation of the  $E$  error is given, taking into consideration the screening effect.

The number of electron-positron pairs produced at depths of  $1.0t_0$  and  $1.5t_0$  was measured.

GERASIMOV, R.T. (CONTINUED)

The results agree with the calculated data obtained by the Monte Carlo method, taking into account the effect of the medium on Bremsstrahlung (Landau-Pomeranchik and Ter-Mikaelyan effects).

For 10 cascades with  $e = 1.8 \times 10^{11}$  ev, the probability of  $P(\chi^2)$  from the criterion  $\chi^2 / 2$ , is 2.5 + 5% when compared with the curves which do not consider the effect of the medium, and 80-95% when compared with the calculations that take into consideration the effect of the medium on the Bremsstrahlung.

GERASIMOVA, R.I.

"DIRECT PRODUCTION OF ELECTRON-POSITRON PAIRS BY HIGH ENERGY ELECTRONS"  
R.I.Gerasimova, L.A. Makaryina, Ap.P. Mishakova, A.S. Romantseva, G.S. Stolyarova,  
V.A. Turanyan, S.A. Chyueva, A.A. Varfolomeyev,

The cross-section of direct production of electron-positron pairs by high energy electrons was measured experimentally. For this purpose, a study was made of isolated electron-photon cascades and the photon component of high energy nuclear interactions in emulsion stacks exposed to radiation in the stratosphere. In order to exclude spurious cases of direct pair production, which constitute the main difficulty in experimental measurement of the cross-section of such pairs, the calculation was carried out by the Monte Carlo method.

The calculation was made for three values of primary electron energy: 10; 100 and 1,000 Bev, taking into consideration two possible variants of the Bremsstrahlung spectrum: Bethe-Heitler and Migdal variants (Landau-Pomeranchuk and Ter-Mikaelyan effects). A method for determining the energy of ultra-relativistic electrons from the lateral distribution of the apices of electron-positron pairs is suggested.

During the experimental measurement of very high electron energies, certain possible sources of underestimation were eliminated.

The cross section of direct pair production by high energy electrons was found to be in agreement with Bhattacharya's calculation within the limits of experimental error.

TITLE: Electron-photon showers with energies of  $10^{11} - 10^{13}$  ev.  
in nuclear emulsions

SOURCE: International Conference on Cosmic Radiation. Moscow,  
1959. Trudy. v. 2. Shirokiye atmosfernyye livni i kas-  
kadnyye protsessy, 299-306

TEXT: A detailed investigation was carried out of 15 electron-pho-  
ton showers with energies  $> 10^{11}$  ev., at low depths. In contradis-  
tinction to other works, the results are compared with those ob-  
tained for cascades by the Monte Carlo method. Six emulsion stacks  
were used, with total volume of about 10 liters. In 5 of the  
stacks of emulsion R-НИКФИ (R-NIKFI), the grain density of relati-  
vistic electrons was 30 - 35 grains per  $100 \mu$ . The energy  $E_\gamma$  of  
primary quanta which generate the shower, was determined from the

Card 1/4

Electron-photon showers ...

<sup>31541</sup>

number of cascade electrons of energy higher than  $E_c = 300$  Mev, at a depth of  $2.5 - 3.0 t_0$ . A table lists (for comparison) the values of  $E_f$ , obtained by the Monte Carlo method and by formula

$$R = \frac{1}{16,1} \left\{ 45,0 + \ln \left[ \left( \frac{2x}{E} \right)^2 (1 + 140 x) \right] \right\} \quad (1)$$

where  $x$  is the distance from the pair vertex in cm; this formula is semiempirical and represents the ratio of ionization losses of pairs to those of relativistic electrons; the ionization losses are due to mutual shielding of electron and positron fields. In the experiments, particular care was taken to detect the vertices of the electron-positron pairs, formed at depths  $< 1.5 t_0$ . After determining the lateral shower distribution, the energy of the electrons of the pairs was measured by means of multiple scattering (to an accu-

racy of 20 - 30%) for energies of up to  $(5-7) \cdot 10^8$  ev. The total number of pairs formed at depths  $\leq 1.0 t_0$  and  $\leq 1.5 t_0$  with energies higher than (1-2) Mev, is plotted in two figures, from which it is evident that the experimental points fit better the curve which takes into consideration the influence of the medium on the bremsstrahlung (the curve obtained by Migdal's formula); the curve obtained by Bethe-Heitler's formula does not fit the experimental results. The figures also show that not one of the 15 showers under consideration is anomalous. Apparently, the majority of so-called "anomalous" showers, described in literature, can be explained by statistical fluctuations in the cascades or by improper determination of the energy of primary electron-positron pairs. Another figure exhibits the experimental curves of longitudinal shower development; here, too, no appreciable deviations from the corresponding theoretical curves are observed. A table lists data on the number of pairs formed at small distances  $r < 0.5\mu$  from the nearest electron track; these data might be useful in analyzing the cross-section for pair formation by high-energy electrons. There are 4

TITLE:

Ionization Along the Tracks of Electron-Positron Pairs of  
High Energy (Ionizatsiya vdol' sledov elektronno-pozitronnykh  
par vysokoy energii)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959,  
Vol 36, Nr 3, pp 707-716 (USSR)

ABSTRACT:

In the introduction the authors discuss the problem and the results of several already published works dealing with this subject. Table 1 contains for the 5 investigated showers (E-53, O-202, D-84, D-44 and I-109) the data of the emulsion piles in which they were recorded (see previous paper by the same authors, reference 7); table 2 contains a list of the  $E_{\gamma}$ -values according to Janossy (Yanoshi) (Refs 10, 12) and  $E_{\gamma}$  according to Chudakov (Ref 1). (Today it is possible to obtain more exact  $E_{\gamma}$ -values from curves by the Monte Carlo method by taking the influence exercised by matter on bremsstrahlung into account. The publication of respective results has been announced). A very detailed chapter of this paper deals with gauging of the emulsions (type R-NIKFI). The follow-

Card 1/3

SOV/56-36-3-9/71

*Ionization Along the Tracks of Electron-Positron Pairs of High Energy*

ing experimental data concern the track densities of five high-energy electron-positron pairs in these emulsions. Measurements were carried out on the first pairs of electron-photon showers. Pair energy was determined from the energy spectrum of the cascade electrons at a distance of 2.5 - 3 radiation lengths from the vertex of the first pair. In three cases pair energy was nearly  $.10^{12}$  ev and in two cases it was approximately  $3.10^{11}$  ev. Track density was determined by two methods: from the grain density in the track and from the gap length distribution coefficient. Compared with a particle for which the specific energy loss is twice as great as the ionization loss of the electron, the track density of the pair near the vertex was found to be smaller. This decrease of the pair track density can be explained by the mutual screening of the electron and positron during ionization. The results obtained are compared with the theoretical ionization curves for pairs calculated by A. Ye. Chudakov (Ref 1). The authors finally thank Professor I. I. Gurevich for his interest and discussions, A. A. Kondrashina for his help in

"A Certain Case of Solution of Convection Problem with Account of Ratio of Viscosity Coefficient to Temperature"  
Uch. Zap Molotovsk. un-ta, 8, No 3, 1954, 87-90

Equations of convection are solved taking into account the viscosity in the case of an infinite vertical slit with plane parallel walls heated to different temperatures. Exact stationary solutions are found in two cases in which the ratio of viscosity to temperature is linear and may be expressed by Bachinskiy's formula. The temperature distribution in this case is linear and the heat transfer from hot to cold wall is determined by the molecular heat conductivity of the liquid. (RZhFiz, No 9, 1955)

TITLE: The effect of thermal diffusion on the thermal convection  
of a binary mixture

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, v. 5, no. 7, 1962, 52-58

TEXT: The steady thermal convection of a binary mixture in a vertical  
cavity was investigated, allowing for the effect of thermal diffusion  
and making the following assumptions: (1) The velocity, temperature,  
pressure, and concentration of the mixture are independent of y;  
(2) the velocity of the fluid has only a z-component; (3) the temperature  
of the mixture depends only on the transverse coordinate x of the cavity.  
A purely mathematical analysis of the system of equations

$$-\frac{1}{\rho_0} \frac{dp}{dz} + \frac{d^2v}{dx^2} + g(\beta T + \alpha c) = 0, \quad (1)$$

$$\frac{dT}{dx} = 0, \quad (2)$$

Card 1/2

S/170/62/005/007/006/010

B104/B112

The effect of thermal diffusion ...

$$v \frac{\partial c}{\partial z} = D \left( \frac{\partial^2 c}{\partial x^2} + \frac{\partial^2 c}{\partial z^2} \right). \quad (3)$$

shows that the non-uniformities in concentration can be represented by  $c(x, z) = Bz + c'(x)$ . Thus, Eqs. (1)-(3) can be reduced to a system of ordinary linear differential equations. The distribution of concentration is given by

$$c_1 = \frac{DK_1^2}{\chi C} z - C \left[ \frac{K_1^2}{24} \left( \frac{x^6}{5} - \frac{x^4}{2} + \frac{x^2}{3} \right) + \frac{\alpha h}{\beta K_1^2} x \right] + c_0. \quad (18),$$

where  $K_1$  is Rayleigh's diffusion number and  $c_0$  denotes a standard concentration. The great effect of thermal diffusion on thermal convection is demonstrated by a comparison of Eq. (18) with a formula for the distribution of concentration derived without allowing for the effect of thermal diffusion. There are 2 figures.

TITLE Electric Photography on Luminescent Substances.  
(Elektrofotografiya na luminoforakh - Russian)

JOURNAL Doklady Akademii Nauk SSSR, 1957, Vol 113, Nr 3, pp 571-572, (U.S.S.R.)  
Received 6/1957

REVIEWED Reviewed 7/1957

ABSTRACT Experiments were carried out in order to obtain images on the surface of paper or metals which were coated with a luminescent layer which, at the same time, was photoconductive. The following material was used, [CdS, ZnS]Cu, which has its maximum photoconductivity at  $\lambda = 340 \text{ m}\mu$ , and [CdS, ZnS]Ag, which has its maximum photoconductivity at  $\lambda = 44 \text{ m}\mu$ . The surface of the layer could be charged in the dark by means of the corona discharge. The image on the surface of the layer was obtained by projecting an image on to the surface of the luminescent substance charged in this manner by means of a photoenlarging apparatus. The time of exposure corresponded to the relaxation period of the surface charge which had been previously measured for the respective layer. Developing was carried out by spraying the layer with inversely charged colored resin particles. The particles were charged by means of friction electricity. An additional peculiarity of electrophotography was the possibility of watching the luminescent substances in the dark while they were illuminated by ultraviolet light (with 365 m $\mu$  wavelength). Good results were also obtained with other photoconductive layers, as e.g. ZnO and CdS.

TITLE: Migration of Alkylsulfonyl Residue in Alkyl-(1-Chloronaphthyl-8)-Sulfones

PERIODICAL: Khimicheskaya nauka i promyshlennost', 1959, Vol 4, Nr 3,  
pp 414-415 (USSR)

ABSTRACT: The study of the reactions of peri-substituted naphthalenes has demonstrated that heating of methyl-(1-chloronaphthyl-8)-sulfones with concentrated hydrochloric acid for 5 hours at 200°C causes the irreversible migration of the sulfonyl residue. It has been shown that the migration of the alkylsulfonyl residue is characteristic only for 1,8-isomers and seemingly connected with the spatial interaction of peri-substitutes leading to the migration of these substitutes from the plane of the naphthalene nucleus.

TITLE: Brief Communication. Isomeric Conversion of Methyl-(1-Chloronaphthyl-8)-Sulfone

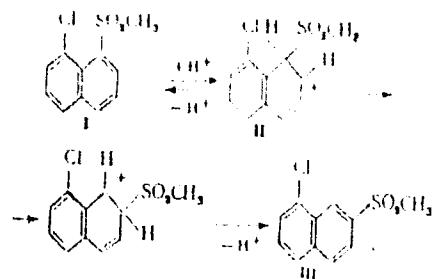

PERIODICAL: Khimicheskaya nauka i promstrenost', 1959, Vol 4, Nr 6, pp 807-808 (USSR)

ABSTRACT: In the previous work (the same authors, Khim. nauka i prom., 4, Nr 3, 414, 1959), it was shown that alkyl(1-chloronaphthyl-8) sulfone, by heating with conc. HCl, at 200-230° is isomerized into alkyl(1-nitronaphthyl-7) sulfone (III) as follows:

Card 1/4

Brief Communication. Isomeric Conversion  
of Methyl-(1-Chloronaphthyl-8)-Sulfone

7726  
SOV/63-4-6-30/37

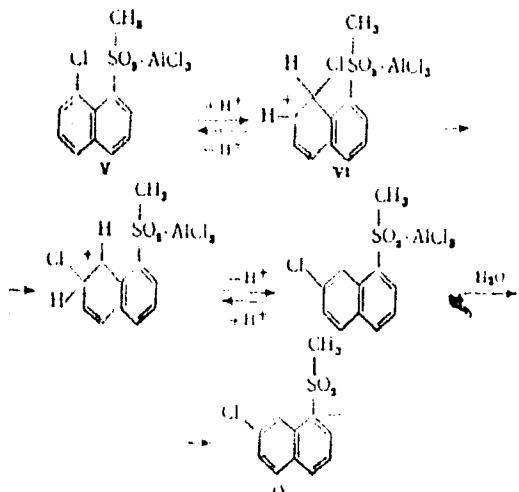

I was heated with 2 g/mol. of  $\text{AlCl}_3$ , for 1 hr at 125°, in the presence of dry  $\text{HCl}$ , and methyl(1-chloronaphthyl-8) sulfone (IV) was obtained (in 50% yield) instead of III. In the above case the migration of chlorine atom occurred, instead of methylsulfonyl radical migration.

Card 2/4

Brief Communication. Isomeric Conversion  
of Methyl-(1-Chloronaphthyl-8)-Sulfone

Card 3/4

Brief Communication. Isomeric Conversion  
of Methyl-(1-Chloronaphthyl-8)-Sulfone

77236  
SOV/63-4-6-30/37

In the present work, the conversion of I in the presence of  $\text{FeCl}_3$  was studied. Heating I with  $\text{FeCl}_3$  (ratio: 1 to 0.5 g/mole), at  $150^\circ$  for 6 hr, in a stream of HCl forms III. The migration of chlorine atom was practically not observed. In the absence of catalyst, at  $230-250^\circ$ , and in a stream of HCl, the isomerization was not observed. There are 2 Soviet references.

TITLE: Steric Hindrance and the Reactivity of Organic Compounds.  
I. Migration of the Alkylsulfonyl Radical in Alkyl  
1-Chloronaphthyl-8 Sulfones

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol 30, Nr 2, pp 612-618  
(USSR)

ABSTRACT: Isomeric transformation of 1,8-dihalonaphthalenes proceeds easily even without catalysts; this is explained by the steric interaction of the halogen atoms in periposition. Van der Waals' radius of Cl is 1.80 Å, that of Br 1.95 Å, whereas the distance between C<sub>1</sub> and C<sub>8</sub> in the naphthalene molecule is only about 2.5 Å. The molecule is subjected, therefore, to a deformation, and to a deviation of the halogen atoms from the plane of the naphthalene molecule, followed by a change in the values of the bond angles at C<sub>1</sub> and C<sub>8</sub>. The hybridization of the valence electrons of similar atoms cannot correspond any longer to the pure

Card 1/7

SOV/79-30-2-54/78

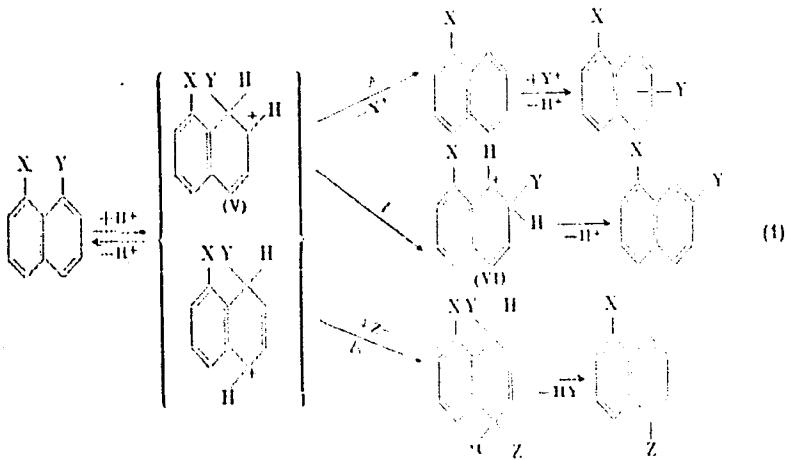

( $sp^2$ ) $p$  type of a plane trigonal system and approaches to some extent the tetrahedral ( $sp^3$ )-hybridization. This must facilitate the formation of an activated complex in the attack of these atoms by the electrophilic particle. The increased affinity of C<sub>1</sub> and C<sub>8</sub> atoms of the 1,8-disubstituted naphthalenes towards the electrophilic particles creates, in particular, favorable conditions for the protonation of these atoms and for the formation of  $\sigma$ -complexes. The authors assume, accordingly, that three types of transformations can take place in such cases, as shown in the formulas (1):

The following transformations can serve as examples of the above reactions: 1,8-dibromo-2,7-dihydroxynaphthalene into 1,6-dibromo-2,7-dihydroxynaphthalene, reaction A; 1,7-dichloronaphthalene into the 1,5-isomer, reaction B; (X=Y=Z=Cl); 1,8-dichloronaphthalene- $\beta$ -sulfonic acid into 1,7-dichloronaphthalene, reaction C. The present study deals with the migration of the radical in similarly perisubstituted alkyl 1-chloronaphthyl- $\beta$ -sulfone.

Steric Hindrance and the Reactivity  
of Organic Compounds. I

77903  
SOV/79-30-2-54/78

Such sulfones were obtained on boiling for 3-5 hr a mixture of methanol solutions of sodium ethoxide and chloronaphthalenesulfonic acid with methyl iodide, ethyl iodide, or benzyl chloride. The sulfone precipitate was filtered, washed with 5% soda solution and water, and recrystallized from methanol. The following new sulfones were obtained: methyl 1-chloronaphthyl-5 sulfone (mp 141.0-141.5°C); methyl 1-chloronaphthyl-7 sulfone (IVa) (mp 160.5-161.0°C); methyl 1-chloronaphthyl-8 sulfone (Ia) (mp 126.5-127.0°C); methyl 2-chloronaphthyl-8 sulfone (mp 117.5-118.0°C); ethyl 1-chloronaphthyl-7 sulfone (IVb) (mp 122.0-122.5°C); ethyl 1-chloronaphthyl-8 sulfone (Ib) (mp 143.0-143.5°C); and benzyl 1-chloronaphthyl-8 sulfone (mp 170.5-171.0°C). Yield of the methyl chloronaphthyl sulfones was 72-88%; that of ethyl chloronaphthyl sulfones, 42-67%. Heating Ia and Ib with concentrated HCl at 200°C and 220-230°C, respectively, caused an irreversible migration of the alkylsulfonyl radical into  $\beta$ -position and the formation of sulfones IVa and IVb in 40% and 60% yield, respectively. This migration was

Card 5/7

Steric Hindrance and the Reactivity  
of Organic Compounds. I

77903  
SOV/79-30-2-54/78

due to the steric interaction of the Cl atom and the sulfonyl radical which caused a deviation of these substituents from the plane of the naphthalene ring. The other sulfones did not change on heating with concentrated HCl; it follows that the migration of the sulfonyl radical is characteristic solely of the 1,8-isomers. Elimination of the chlorine atom was achieved by hydrogenation of the alkyl chloronaphthyl sulfones in methanolic alkali solution over Pd. In this reaction, methyl 1-chloronaphthyl-5 sulfone, methyl 1-chloronaphthyl-8 sulfone, and methyl 2-chloronaphthyl-8 sulfone gave, respectively, methyl naphthyl-1 sulfone (mp 101.5-102.0° C from methanol), and methyl 1-chloronaphthyl-7 sulfone gave methyl naphthyl-2 sulfone (mp 141-141.5° C). Similarly, ethyl 1-chloronaphthyl-8 sulfone gave ethyl naphthyl-1 sulfone (mp 88-89° C), and ethyl 1-chloronaphthyl-7 sulfone gave ethyl naphthyl-2 sulfone (mp 42-44.5° C). Yield of the dechlorinated sulfones was 83.5-97%. There are 1 table; and 31 references, 7 U.S., 6 U.K., 1 Canadian, 2 French, 1 Swedish, 1 Danish, 7 German, and 6 Soviet. TITLE: Control system for the RM-700 telescope

SOURCE: Novaya tekhnika v astronomii; materialy\* soveshch. Komissii priborostroyen. pri Astronom. sovete AN SSSR, Moskva, 18-20 apr. 1961 g. Moscow, Izd-vo AN SSSR, 1963, 23-27

TOPIC TAGS: control system, automatic control, RM 700 telescope, telescope, ETsUM digital control machine

ABSTRACT: A 700-mm reflector telescope (called the RM-700) has just been built at the Pulkovskaya observatoriya (Pulkovo Observatory). It will be equipped with a double control system. One aspect is a semiautomatic control from a key or with one of two panels operating by semiautomatic control. The position of the telescope will be computed on this panel, each coordinate having a double-metering selsyn connection operating as an indicator. The hour mechanism will be a synchronous motor, supplied by a quartz-crystal clock. The second part of the system is

Card 1/2.

ACCESSION NR: AT3008538

automatic control by means of a digital electronic control device (ETsUM). This device has been described by Yu. A. Belyayev (1961, Izv. GAO AN SSSR, 169). It operates with a binary code of sidereal time, computed in angular scale from the panel. This involves the use of a quartz-crystal clock running on sidereal time, a frequency divider and power amplifier, a frequency converter, and a cumulative adder. The operation of the parts is described in considerable detail. "B. N. Batanov (deceased), Yu. N. Gell', and A. V. Korolev participated in this work." Orig. art. has: 7 figures.

Title : Colorimetric Method for the Determination of Sodium  
in Soda-Lime Glass without Taking a Weighed Sample

Orig Pub : Zavod. laboratoriya, 1956, 22, No 7, 794-795

Abstract : On the cleansed surface of a standard and of the glass sample being tested, within a specially provided paraffin-enclosed area, are placed 2 drops of  $H_2F_2$  and allowed to remain there for 5 minutes while being stirred with a paraffin-coated glass rod. After 5 minutes into each of the paraffin enclosed areas are added 2 drops of water and the resulting solutions are transferred, by means of glass capillaries, into Pt crucibles. The paraffin enclosed areas are rinsed 4-5 times with water, which is applied 1 drop at a time, and the washings are added to the previously obtained solutions. After this there is added to each

TITLE: Ceramic Pyrosopes for Temperature Measurement in a Regenerating Medium (Keramicheskiye piroskopy dlya izmereniya temperatur v vosstanovitel'noy srede)

PERIODICAL: Ogneupory, 1998, Nr 1, pp. 23 - 26 (USSR)

ABSTRACT: A. V. Tereshchenko and I. Ye. Dudavskiy point out that the temperature of the fall of pyroscope depends on a number of factors, such as: dispersion, chemical and mineral composition of the pyrosopes, their shape, dimensions and their manner of installation , as well as the speed of the temperature increase. Various admixtures in the composition of the pyroscope may change the temperature of their fall in both directions, in dependence on the composition of medium in the furnace. According to the data by Vickers the influence of the admixtures  $Fe_2O_3$  in different gas mediums is characterized by figures which are recorded in table 1. The pyroscope produced both in this country and abroad consist of clay, kolin, quartz, feldspar, marble and so on with admixtures. Such pyrosopes are used in furnaces with oxidizing or neutral medium . Furnaces with regenerating medium were recently widely spread. They possess a hydrogen-ammonia medium and others and are used for annealing

Ceramic Pyrosopes for Temperature Measurement in a Regenerating Medium

and soldering; various metals for sintering hard-metal alloys, for burning highly aluminiferous ceramics of pure oxides which require a high temperature and a regenerating medium respectively for burning. In order to be able exactly to measure the temperature in electric furnaces with regenerating medium in the range of from 1500 to 1800°C, tests were performed with various existing devirs and pyrosopes. After these tests had yielded a negative result (as may be seen from table 2 and figure 1) pyrosopes of aluminum oxide (alumina) with an admixture of fluxing agents were produced which are destined for use in a regenerating medium (WKB). For the purpose of determining the composition of these pyrosopes, tests with synthetic fluxing agents were performed, as is to be seen from table 3. As aluminum oxide the authors used an argillaceous earth of the brand "To burnt at 1640°C in a regenerating medium; its chemical composition is given in table 4. The pyroscope with 30% admixture of fluxing agents showed full temperatures which are recorded in table 5. Pyrosopes with admixture of 5 to 50% of thefluxing agent N 3 behaved as may be seen from table 6. The pyrosopes were installed on corundum bases according to GOST 4069-48. The comparison of the operation of these pyrosopes in a nitrogen-hydrogen medium and in krypton furnace is shown in

TITLE: Preparation of indium phosphide. Class 12, No. 175049 [announced by Scientific Research Institute of Fertilizers, Insecticides, and Fungicides (Nauchno-Izследovatel'skiy institut udobreniy i insektifungitsidov)]			
SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 19, 1965, 16			
TOPIC TAGS: indium phosphide, inorganic synthesis			
ABSTRACT: An Author Certificate has been issued for a preparative method for indium phosphide involving the heating of metallic indium with phosphorus trichloride. To increase the yield and improve the purity of the end product, the reaction is conducted at 700-750° with subsequent cooling of the reaction mixture to room temperature.
