TITLE: Aspects of the economic efficiency of technical-scientific research in the chemical industry

SOURCE: Revista de chimie, v. 16, no. 5, 1965, 269-277

TOPIC TAGS: chemical industry, scientific research

ABSTRACT: After briefly describing the principal methods used to evaluate the economic efficiency of research work, the author gives some concrete examples relating to various research projects carried out and applied in the Rumanian chemical industry. It is emphasized that other factors besides the purely cost-influencing ones must be considered in the analysis, e.g., improved quality, use of indigenous raw materials, etc. Some suggestions are also presented for improving the efficiency of scientific research in the chemical industry through better planning and organizational measures for the most rational possible use of the research personnel. Orig. art. has: 5 figures and 2 tables. [Based on author's Eng. abstr.] [JPRS]

TITLE: Decomposition of pore-forming substances

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 2, 1962. 614 abstract
2P350 (Ind. usocara, v. 8, no. 2, 1961. 55 - 62)

TEXT: The kinetics of decomposition of dinitroso pentamethylene tetramine (I) and benzosulfo hydrazide (II) was studied as dependent on temperature and a large amount of ingredients of rubber mixtures. The volume of the gas separated at constant temperature as a function of time was expressed in ml/g of the pore-forming substance. The decomposition curves for pure II increase with increasing temperature. The end volume of the separated gas at 25°C and normal pressure is 120-130 ml/g. Tselofor (a mixture of I with kaolin, 1:1) does not decompose at 145°C, partially at 165°C. The mixture ingredients accelerate, retard, or do not affect the decomposition of I and II. Clarification of the relationship between the chemical structure of the ingredients investigated and their effect on the decomposition of pore-forming substances is rendered difficult by the absence of an exact

TITLE: Action of petroleum products and greases on a mixture of
(60-40) butadiene acrylonitrile rubber

PERIODICAL: Referativnoy zhurnal. Khimiya, no. 9, 1962, 642, abstract
SP302 (Ind. usoara, v. 8, no. 4, 1961, 139 - 147)

TEXT: Data are given for the swelling and the changes in physico-mechanical properties that occur in 36 different mixtures of perbunan 3810 which has been aged for 144 hours at 70° and 100°C, and has remained for 24 and 72 hours at 100°C in milk, mineral, vegetable or solar oils, or animal fat, or at 25°C in gasoline, a gasoline-benzene mixture (75:25) or non-paraffinous petroleum, mineral, solar and vegetable oils and milk. The mixtures were made with Carbojet channel black (A), Furnal R300 furnace black (B), Methanex black (C) and VN₃ Ultraseal (D). Two different accelerators were used in each group. Group A. Altering the amount and nature of the accelerator has little effect on swelling; but at temperatures up to 100°C swell-
Card 1/2

Action of petroleum products ...

B160/B101

ing increases when the amount of accelerator is increased. At 100°C no correspondence is observed between the amount of accelerator and the swelling. A change in the amount of accelerator does not change the physico-mechanical properties upon aging. The polar media and mineral oil extract the components from the mixtures. In milk the weight of the specimens increases during the first 24 hrs, after which extraction takes place. Group B. Changing the amount and nature of the accelerator has no effect on aging in the different media but has some effect on swelling. The polar media and mineral oil act in the same way as on Group A. An increase in weight in milk occurs in the first 52 hours at 100°C or 72 hours at 25°C. Group C. The effect of the accelerator, mineral oils and polar liquids is the same as in Group B. In milk no extraction takes place in 3 days at 100°C. When the filters in Groups A, B and C are combined there is a slight reduction in the swelling in the gasoline and benzene mixture. Group D. The mixtures swell more than the mixtures in Groups A, B and C. Milk has a stronger effect on the swelling and the mixture's components are not extracted. The behaviour of the mixtures in the polar media depends on the amount and nature of the accelerators. In non-polar media a change in the amount of accelerator has the same effect as in mixtures A, B and C. [abstracter's note: Complete translation.]

Cluj, Transylvania. Institutul Politehnic

Lucrări științifice (Scientific Works) Cluj, Intreprinderea Poligrafica, 1959.
637 p. Errata slip inserted. No. of copies printed not given. No contributors mentioned.

PURPOSE: This book is intended for mathematicians, physicists, chemists, and civil and mechanical engineers.

COVERAGE: The book consists of 59 papers by Rumanian specialists on problems in science and technology, particularly mathematics, physics, chemistry, metallurgy, civil and mechanical engineering. Summaries in Russian and French or German are given at the end of each article. Some of the articles are accompanied by references. No personalities are mentioned. At the back of the book there are 23 references, all Rumanian.

Title : Effect of Argon on the Spectrum of I₂ Vapor

Orig Pub : Commun. Acad. RFR, 1955, 5, No 10, 1439-1448

Abstract : Examination of the effect of argon on the visible and ultraviolet spectrum of iodine vapor. The emission was studied in the 3100--3450 A range, in which the diffuse bands of the emission spectrum acquire a structure under the influence of argon; various argon pressures were used. An explanation is offered for this process. The data obtained are compared with the results cited in the works by Vencatersvarlu and Rao, and some disagreement is noted. The cessation of emission in the visible spectrum in the presence of argon (at 10 mm mercury), observed by Vencatersvarlu, is confirmed by the authors' experiments. Also confirmed is the vanishing of the emission spectrum of iodine vapors, previously observed by the authors, except for the 3400 A region in the presence of air at approximately 12 mm mercury. An investigation was made of the effect of argon on the absorption of iodine (using the hyperfine structure of the 5461 A Hg line) and also of the effect of absorption of I₂, both in the presence and in the absence of argon, on the width of the lines of the 5461 A hyperfine structure. A greater broadening of the absorption line was

TITLE: The determination of the Rayleigh constant in binary mixtures of liquids

PERIODICAL: Referativnyy zhurnal, Fizika, no. 10, 1962, 3, abstract 10G20
("Studii și cercetări fiz. Acad. RPR", 1961, v. 12, no. 4,
305 - 314, Rumanian; summaries in Russian and French)

TEXT: A photoelectric apparatus was used to determine the Rayleigh constants and the depolarization factors in the binary mixtures benzene-methyl alcohol and benzene-dioxane in various concentrations. The role of coherent (due to fluctuations of concentration and density) and incoherent (due to fluctuations of anisotropy) light scattering components is shown. The confrontation of experimental data with theoretical predictions shows satisfactory agreement when allowing for the change of the refractive index as a function of concentration and density in elementary volumes, considered in the scattering theory, to be identical with the change in the macroscopic value of the refractive index.

TITLE:

The Obtaining of Tungsten Powder from Scales

PERIODICAL:

Metalurgia și construcția de mașini, 1959, Nr 6, pp
464-466 (RUM)

ABSTRACT:

The Central Laboratory of the plant "23 August",
Bucharest, tackled the problem of obtaining tungsten
from the scales formed on the skin of forged rapid
wolfram-steel parts. The present article describes
the experimental results of the extraction of WO_3
from the scales and obtaining tungsten by reduction
of oxides. At the present time research is being
continued toward obtaining the wolfram carbide powder
starting either from the tungsten thus obtained, or
directly from tungsten oxide WO_3 or from the ammonium
parawolframate. The scales formed in wrought or lami-
nated rapid steel is by its quantity a significant
source of tungsten or tungsten carbide powder which
would be sufficient to satisfy the present needs of

The Obtaining of Tungsten Powder from Scales

wolfram powder for Rumania, the authors write. At the present time, the scales are lost for the Rumanian economy, as they are given no utilization. The authors describe the method applied. The tungsten oxide contained in the scales is turned into soluble sodium tungstate. From the solution of sodium tungstate, wolframic acid is precipitated by means of concentrated hydrochloric acid. The acid is filtered and is transformed into WO_3 through a drying and calcination process. The method has been described by F.H. Scott. The authors tried to pass through ammonium parawolframate to obtain a pure product. Based on the experimental results presented, the authors conclude that the method could have economic significance for Rumania. There are 5 tables, 5 photographs, and 1 Rumanian reference. ✓
