AUTHOR: Artemov, K. P.; Gol'dberg, V. Z.; Rudakov, V. P.

TITLE: Elastic and inelastic scattering of Alpha particles by Al sup 27

SOURCE: Atomnaya energiya, v. 14, no. 5, 1963, 482-484

TOPIC TAGS: elastic scattering, inelastic scattering, Alpha particles, excited states of Al sup 27

ABSTRACT: The Alpha particles were accelerated to 40, 38, and 36 Mev in the 1.5 m cyclotron of the Institute for Atomic Energy. A high pressure ionization chamber was used for detection of Alpha particles. In agreement with the results of other workers, the angular distribution of scattered particles showed a "diffraction pattern," the maxima of the inelastically scattered particles coincided with the minima of those scattered elastically. The results are interpreted on the basis of theory by other authors, among them S. I. Drosdov (Zh. eksperim. i teoret. fiz., 31, 901, 1956). The radius of interaction of the Alpha particle with the Al-nucleus is found to be 5.5 fermi. Conclusions are made concerning the excited states in Al sup 27. "The authors are grateful to S. I. Drosdov for the discussion of results of the work." Orig. art. has: 3 figures and 6 references.

TITLE: Analysis of elastic scattering of He-3 and Alpha particles on the basis of the optical model of the nucleus

SOURCE: Zh. eksper. i teor. fiz., v. 47, no. 2, 1964, 571-576

TOPIC TAGS: helium, elastic scattering, alpha particle reaction, differential cross section, optical potential

ABSTRACT: Although a detailed analysis of elastic scattering of alpha particles by many nuclei from C^{12} to Th^{232} was made by Igo and Thaler (Phys. Rev. v. 106, 126, 1957), no such analysis was made for the elastic scattering of He^3. Earlier calculations, made on the basis of a limited experimental material, have led to parameters that vary erratically from nucleus to nucleus. The authors have therefore used the optical model to attempt a more systematic

ACCESSION NR: AP4043632

analysis on the data concerning elastic scattering of He^3 by different nuclei, and calculated the differential cross sections for this scattering. New data obtained on the differential cross sections at the laboratory of the authors (V. M. Pankratov and I. N. Serikov, ZhETF, v. 44, 187, 1963) and by Gonzalez-Vidal et al. (UCRL-9566, 1961) have been used in the calculations. The results show that a single set of parameters for the optical potential can be used to describe satisfactorily the experimental data over the wide range of nuclei from Be^9 to Bi^{209}. A comparison is given of the parameters of the potentials describing the elastic scattering of He^3 and of alpha particles by Al^{27}. "The authors thank V. A. Belyakov, P. E. Nemirovskiy, and I. S. Shapiro for useful discussions." Orig. art. has: 3 figures and 3 tables.

TITLE: Forks No Longer Break (Vilki perestali lomat'sya)

PERIODICAL: Tekhnika molodezhi, 1958, Nr 8, pp. 40-40 (USSR)

ABSTRACT: Many cyclists know very well that while they ride along country roads or paved streets at high speed, the fork of their bicycle, which is subjected to considerable vibrational stress, breaks easily. The authors found a simple and reliable method of counteracting this danger by fitting out the front fork of their bicycles, which are provided with a "D-4" motor, with a damper or shock-absorber ("amortizer"). This makes it possible to ride along any kind of road at top speed. Besides, this simple device prolongs the life of the motor. The device is then described. The authors express the opinion that factory-produced forks are more simple and of lighter weight than those made by hand. There is 1 figure.

TITLE: Hematological indices found in X-ray and radiotherapy departmental staff

PERIODICAL: Magyar Radiologia, no. 6, 1962, 321-326

TEXT: The authors analyzed the blood of 130 patients exposed to continuous small doses of ionising radiation by reason of their occupation, and of 75 healthy control subjects not previously exposed to radiation. It was found that the staff of X-ray and radiotherapy departments were on the average exposed to a daily dose of 0.02 - 0.03 r. Some of the subjects complained of occasional headaches, tiredness, and in a few cases skin changes, pigmentations and loss of hair could be observed. In 17% of the exposed persons the white cell count was decreased and in 6.1% it was increased. Among the staff of radiotherapy departments, neutropenia was found in 90.9% of those who worked in these departments for less than 5 years, but only in 75% of those working for more than 5 years. A

TITLE: Determining small concentrations of carbon dioxide in the air with the FEK-N-54 photocolorimeter

SOURCE: Gigiyena i sanitariya, no. 1, 1967, 93-94

TOPIC TAGS: photocolorimetry, carbon dioxide sensor, colorimetry, carbon dioxide/FEK N 54 photocolorimeter

ABSTRACT: The following procedures are used in determining CO_2 concentration in air spectrophotometrically: The air sample is shaken up with an absorbent containing one part 0.125% bromthymole blue and 50 parts of $NaHCO_3$. After interaction with the absorbent, optical density is measured at λ_{max} 600 nm using an SF-5 spectrophotometer in a cell with a ten-mm layer. The concentration of CO_2 is then found using a graduated graph showing optic density as a function of CO_2. Using a variant of this method, the author devised an approach employing the FEK-N-54 photocolorimeter. Air samples were collected in 50--100-ml syringes from closed spaces (dimensions are given). A cell with a ten-mm layer and

TITLE: The ohmic contact between gallium arsenide and indium

SOURCE: Pribory i tekhnika eksperimenta, no. 4, 1966, 189-193

TOPIC TAGS: gallium arsenide, indium, semiconductor research

ABSTRACT: The wetting of gallium arsenide surface with indium, and the extent of fusion and contact resistance as a function of temperature and fusion time were studied. It is shown that 100% wetting and minimum contact resistance occur at a temperature of 500°C and above. The GaAs-In junction was obtained by fusion in hydrogen. Hydrogen was used as the reducing medium to prevent the oxidation of In and GaAs at high temperatures. To prevent the explosion of the hydrogen-air mixture, a neutral gas was passed through the system before and after the hydrogen was turned on. The gases were dried by cooling them to a temperature of -196°C. Activated charcoal was used to purify H_2 and He at liquid nitrogen temperature. The following parameters were determined during the fusion process: the edge wetting angle, contact resistance, wetting coefficient, depth of fusion, and hole shape. The reduced resistance of the *n*-GaAs-In

TITLE: Thin multilayer gallium arsenide-metal contacts

SOURCE: Pribory i tekhnika eksperimenta, no. 6, 1966, 180-184

TOPIC TAGS: ohmic contact, multilayered ohmic contact, gallium arsenide, gold, tin, nickel, zinc, silver, copper

ABSTRACT:

A method of manufacturing gallium arsenide-metal contacts by chemical deposition of thin metal layers has been developed. The method permits uniform coating of gallium arsenide with thin (about 1 μ) layers of various metals with a very small (1 μ) depth of fusion. The main advantage of the small depth of fusion is that the crystals can be cleaved through with the deposited metals. It was found that with only one metal, the contact was either nonohmic, not sufficiently low-ohmic, or technologically unsuitable. The best low-ohmic contacts were obtained with several layers of various metals deposited on gallium arsenide. For instance a contact

TITLE: Second order magnitudes in acoustics. (Nekotoryye velichniny vtorogo poryadka v akustike)

PERIODICAL: "Akusticheskiy Zhurnal" (Journal of Acoustics), 1957, Vol, 3, No.2, pp. 149-153 (U.S.S.R.)

ABSTRACT: The second order acoustical magnitudes have been, for the ideal medium, investigated elsewhere (bibliography in (2)). It is nevertheless of interest to investigate them for the case of a viscous thermo-conducting medium. It has been shown (1) that three particular cases need to be considered (1), every one of them described by equations of the first and of the second order approximation. In (3) expressions of the second order approximation have been obtained for one viscous medium. In the present article the author, using the notation and terminology of (4) and (1) analyses mathematically the solution, obtained in (3) as applied to a plane sound wave for the above 3 cases (1). Second order solutions are found and analysed for the hydro-dynamic velocity v_2, pressure p_2 and density ρ_2 for the three following cases: $N \ll \nu\omega/c^2$. It is shown that for this condition the amplitude of v_2 is linearly proportional to the coefficient of

Card 1/2

Second order magnitudes in acoustics. (Cont.) 46-2-7/23

viscosity and to the frequency and that at a certain distance z_0 from the source, the second order magnitudes decay faster than the magnitudes of the first order. z_0 is called the "relative form stabilising distance". ρ_2 and p_2 are related by the usual relationships of linear acoustics. The second considered case is the condition $N \approx \nu\omega/c^2$ and expressions for the same quantities are derived. It is shown that for a wave of infinite duration the amplitude of v_2 in this case increases for every point in time.

Card 2/2 The third condition is $N \gg \nu\omega/c^2$ and second order solutions are given in eq.(29).

AUTHOR: Gol'dberg, Z.A.

TITLE: On the Propagation of Plane Waves of Finite Amplitude (O rasprostranenii ploskikh voln konechnoy amplitudy)

PERIODICAL: Akusticheskiy Zhurnal, 1957, Vol.III, No 4, pp.[illegible] (USSR)

ABSTRACT: The propagation of plane waves of finite amplitude in a viscous, thermally conducting medium is considered from the point of view of first and second approximation acoustics. A study is made of the criterion which indicates when the accumulation of discontinuities in a plane wave is possible. The distance from the source to the place of accumulation of discontinuities is estimated. Expressions are obtained for the absorption coefficient in the case where discontinuity is impossible as well as the case where it is possible. The above criterion is:

$$0.43\frac{p'}{b_0} \leqslant 1 \quad , \qquad (1)$$

for air and for water the criterion is:

On the [illegible] of [illegible] Finite Amplitude.

$$[illegible] \leqslant 1. \qquad (7)$$

(The notation is defined in Refs.[illegible] of which the present paper is a continuation). The present theoretical results are in agreement with the experimental results reported in Refs.5 and 7. Thus in Ref.5 a linear [illegible] of the absorption coefficient on pressure was observed beginning with p' = 2 atm. This is shown to be in agreement with the present results. According to Ref.7 the increase in the coefficient of absorption is proportional to acoustic pressure in the case of [illegible] alcohol, and [illegible] the waves, and this again is predicted by the present theory. There are [illegible] references, of which [illegible] are Russian and [illegible] English.

TITLE: On Propagation of Plane Sound Waves of Finite Amplitude in a Viscous Heat Conducting Medium (O rasprostranenii ploskikh zvukovykh voln konechnoy amplitudy v vyazkoy teploprovodyashchey srede)

PERIODICAL: Akusticheskiy Zhurnal, 1960, Vol 6, Nr 1, pp 113-120 (USSR)

ABSTRACT: The author uses Lagrange's variables x, t to discuss an acoustic field produced in the region $x > 0$ by a plane vibrating along the x-axis at the point $x = 0$ under the following intial and boundary conditions: (I) - displacement of the particles in the medium is $u(x, t) = 0$ at $t \leqslant 0$; (II) - at $t > 0$ we have $u(0, t) = f(t) = a(1-\cos\omega t)$; (III) - there are no reflectors at $x > 0$, i.e. only the wave moving from the vibrating plane in the diraction of positive x is considered. The equation of motion is solved using the Krylov-Bogolyubov method (Ref 3). The expression obtained for the vibrational motion of the particles of the medium shows that in propagation of waves of finite amplitude their profile is distorted because of differences in velocities on various points of this profile. The wave amplitude decreases with

TITLE: Interaction Between Plane Longitudinal and Transverse Elastic Waves

PERIODICAL: Akusticheskiy zhurnal, 1960, Vol. 6, No. 3, pp. 307-310

TEXT: The present article describes a theoretical investigation of the interaction between elastic waves in an unbounded, isotropic solid. The equations of motion (5) used for this purpose take account of both the linear terms and the terms which are quadratic with respect to the derivatives of the deformation vector u. For the special case of plane waves the general system (5) can be transformed into the system (6) - (8). In a linear approximation, the latter system consists of three independent wave equations for u_x, u_y, and u_z. This means that longitudinal and transverse waves propagate without affecting one another. The terms which are quadratic in du_i/dx_k depend on all components of the displacement vector. Accordingly, one obtains an interaction of the two kinds of waves only

Card 1/3

Interaction Between Plane Longitudinal and Transverse Elastic Waves

S/040/60/006/003/004/012
B006/B063

in second approximation. A series of peculiarities appears in this connection. A consideration of the propagation of a transverse wave only shows that also a longitudinal wave occurs, whereas vice versa, during the propagation of a longitudinal wave, no transverse wave appears. The shape of the longitudinal wave changes during its propagation, while the transverse wave remains unchanged. These results are finally discussed. N. N. Andreyev and the participants in the author's seminar are thanked for their valuable remarks. There are 4 references: 2 Soviet and 2 US.

TITLE: Waves with finite amplitude in magnetohydrodynamics

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. [illegible], no. 1, 19[illegible], [illegible] - [illegible]

TEXT: [illegible]. [illegible]. Kaplan and K. P. Stanyukovich (DAN SSSR, [illegible], [illegible], [illegible]) have solved the problem of one-dimensional traveling waves propagating transverse to a magnetic field. The solution obtained is valid as long as no discontinuities arise. A similar problem is now considered in magnetohydrodynamics for weak shock waves or waves emitted by a harmonically vibrating plane. The waves are assumed to propagate across the field in a viscous conducting medium. The system of one-dimensional magnetohydrodynamic equations given by L. D. Landau and Ye. M. Lifshits (Elektrodinamika sploshnykh sred - Electrodynamics of continuous media - Gostekhizdat, 1[illegible]) is approximately rewritten in Lagrange variables and solved neglecting terms smaller than second order terms. The solutions permit studying the development of a shock wave as well as estimating the

Card 1/3

duration of this process. Also the deformation during propagation of an initially sinusoidal wave can be studied. In the latter case, for a wave field [illegible] given in the plane a = 0,

$$\varepsilon(a,t) = \frac{b\omega u}{2\alpha_0 u_0^2 r} \sum_{n=1}^{\infty} \frac{\sin n\omega(t - a/u)}{\operatorname{sh} n(\eta a + 1/2R)} \qquad (27),$$

$$b = \frac{4}{3}\eta + \zeta + \varkappa\left(\frac{1}{c_v} - \frac{1}{c_p}\right)\frac{u_s^2}{u^2} + \frac{c_0^2 H_0^2}{16\pi^2 u^2} \qquad (12),$$

$$\varepsilon = 1 + \rho_0 (\partial^2 p/\partial \rho^2)_s / 2u_0^2 + 3H_0^2/8\pi\rho_0 u_0^2$$

is obtained. $R = [illegible]\,\rho_0 u^2/b\omega$; $\vec{V} = (v, [illegible])$; $\vec{H} = (0, H, 0)$,

$$h = \frac{H}{u} v, \quad T = \left(\frac{\partial T}{\partial p}\right)_s \rho' u_0^2, \quad \frac{\partial}{\partial t} = u \frac{\partial}{\partial a}; \quad u = \sqrt{u_s^2 + \frac{H_0^2}{4\pi\rho_0}} \quad (1[illegible]).$$

The result shows that at a distance of the order of a_0 the sinusoidal wave has turned into a sawtooth wave and on further propagation becomes a damped sinusoidal wave. There are 1 figure and 1[illegible] references: 5 Soviet

AUTHORS: Gol'dberg, Z. A., Naugol'nykh, K. A.

TITLE: Rayleigh sound pressure

PERIODICAL: Akusticheskiy zhurnal, v. 9, no. 1, 1963, 28-31

TEXT: The results of Rayleigh (Phil. Mag., 1905, 10, 364-374) obtained for the sound pressure on a fixed rigid wall for the case of a medium vibrating between two fixed plane rigid boundaries are generalized for a forced vibration of the medium produced by harmonical motion of one of the two boundaries. In linear approximation of the sound field the radiation pressure of a standing wave on the fixed boundary is

$$\overline{p'} = \frac{\gamma+1}{4}\rho_0 v_0^2\left(1+\frac{\sin 2kl}{2kl}\right), \qquad (9),$$

where $v_0 = A\omega/\sin(kl)$ is the particle velocity, ξ is the mean shift of the particles from their equilibrium position, A is a constant, k is the

Card 1/2

wave number, ω the angular frequency. If $kl \ll 1$ or $kl \to n\pi$ (resonance), v_0 and with it $\bar{p}'$ increases unlimitedly. In the case of spherical standing waves produced between two concentric spheres by vibration of the inner sphere the pressure at the unmoved outer sphere is

$$\overline{p'}(R_2) = \rho_0 \frac{A^2 k^2}{4} \frac{\sin^2 kR_1}{R_2^2} + c_1. \qquad (16).$$

This formula is specialized for a quiet inner sphere and a vibrating outer sphere, for a zero radius of the inner sphere and for a standing wave between non-vibrating spheres.

TITLE: Thermal stability of alloys of tungsten-cobalt carbides

SOURCE: Poroshkovaya metallurgiya, no. 10, 1966, 71-77

TOPIC TAGS: thermal shock simulation, heat resistant alloy, tungsten carbide, cobalt, bend strength, grain size, grain structure, hardness

ABSTRACT: Thermal shock testing of alloys of tungsten-cobalt was made by water quenching samples from temperatures up to 1120°K. The furnace capacity was sufficiently great to test 20-40 samples simultaneously. Specimens were held 5 min in the furnace and 0.5 min in the quenching bath. Thermal shock stability was measured in terms of superficial cracks and the decrease in ultimate bend strength after thermal cycling. The cobalt content of the samples ranged from 1 to 30 wt %, while some samples containing 20-30% cobalt were alloyed with 0.8 or 2.1% titanium, chromium, or molybdenum. The porosity did not exceed 0.2 vol %. The first set of experiments was conducted on 5 × × 5 × 35 mm samples quenched from 770°K. Thermal shock resistance increased sharply above 15% Co. Up to 6% Co the number of thermal shock cycles needed to induce macro-

Card 1/2

ACC NR: AP5034020

cracks was 7 or less; at 15 to 30% Co no cracking was observed after 500 cycles. Small grained samples had a lower thermal shock stability. A microstructural analysis was made on samples with 25% Co, alloyed with either Ti, Cr, or Mo. The volume distribution of grain size was given for the different alloys, before and after 300 cycles of thermal shock testing. The ultimate bend strength of 2 × 5 × 35 mm samples, quenched from 1120°K, is given as a function of the number of cycles. The greatest drop in strength occurred after 100 cycles. Alloy VK20 (20% Co) had the highest bend strength while VK30 (30% Co) had the lowest for all thermal shock cycles, ranging up to 500. The effect of thermal cycling on Vickers hardness was negligible. It is concluded that the mechanism of strength decrease during thermal cycling is associated with fine structural changes, which could not be observed by the techniques described above. TITLE: Helium lines in the spectra of chromospheric flares

SOURCE: Ref. zh. Astronomiya, Abs. 12.51.399

REF SOURCE: Izv. Gl. astron. observ. v Pulkove, v. 24, no. 2, 1965, 35-40

TOPIC TAGS: chromosphere, helium, spectrum, chromosphere flare, solar flare, ionized helium, neutral helium

ABSTRACT: An article of the same title by the author (Goldberg-Rogozinskaya, N. M., R. Zh. Astr, 1963, 2.51.429) is continued. Lines of neutral helium λλ4471, 4713, 4922, 5016, 5876, and a line of ionized helium λ4686 were observed during three flares of 2 April, 30 April and 6 August 1960. The line profiles are wide and nonsymmetrical. Real interior movements explain the profiles observed better than do thermal processes. The electronic density n_e and the electronic temperature T_e in the flares is evaluated by the intensities of the lines. In the case of neutral
