"A Simple Test of Respiratory Function in the Differential Diagnosis of Respiratory Disorders."

Budapest, Orvosi Hetilap, Vol 104, No 2, 13 Jan 63, pp 56-58.

Abstract: [Author's Hungarian summary modified] Comparison of forced inspiration and expiration appears to lead to a differentiation of emphysemal and especially bronchitic respiratory difficulties. The forced inspiratory test results may be normal in cases of emphysema while both test results are lower in cases of bronchitis-bronchospasms. About 90 % of 418 patients showed a definite correlation between the clinical picture and the respiratory function test results. Three of 18 references are Hungarian, the rest Western.

"Rattus norvegicus as Pathogenic Germ Carrier."

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 11, No 5, Sep-Oct 66, pp 431-435.

Abstract [Authors' English summary modified]: The authors studied 106 rats caught in food enterprises to determine the percentage of carriers of pathogenic and conditionally pathogenic germs. Of the total, 15.9 percent were carriers of S. enteritidis Gaertner and 1.8 percent of S. typhi-murium. Among the conditional pathogenic species, the rats were carriers of Arizona, Citrobacter, Aerobacter and Enterococcus species, the latter represented by Str. faecalis in 74 percent of the strains. Approximately 8.5 percent of the animals showed potentially entero-pathogenic coli-like organisms.

TITLE: Importance of cytostatics in the treatment of mammary carcinoma

22

SOURCE: Magyar radiologia, no. 6, 1965, 345-350

TOPIC TAGS: cancer drug, chemotherapy

ABSTRACT: The presently used cytostatic drugs are of no importance in the treatment of mammary carcinoma. In the early stage of the disease, good results can be expected from a combination of the two classical therapeutic procedures. At this stage, the use of cytostatics can only be accepted as justified if they do not represent an unnecessary stress to the organism but can demonstrably improve the results already achieved with the two classical modes of treatment. "Behavior of the Parameters of Blood pH and the Acid-Base Equilibrium in the Course of Exchange Transfusion in the Newborn."

Budapest, Orvosi Hetilap. Vol 107, No 41, 9 Oct 66, pages 1921-1925.

Abstract: [Authors' Hungarian summary modified] In the course of exchange transfusion in 12 newborn it was found that, among premature infants under 2500 g weight, the blood pH will show a continued, moderate lowering but it will become normal within 24 hours at the latest. In heavier infants, normalization will start as early as the blood exchange. The rate of normalization of blood pH will be slowed down slightly when large amounts of blood are used for the exchange and the icterus is more severe with a serum bilirubin level over 20 mg %. It is probable that the development of a more severe acidosis is prevented by the Na bicarbonate produced from the citrate metabolism. Small-weight infants with high serum bilirubin level are also able to decompose citrate although the process is slower than in the newborn of normal weight. On the basis of these observations it is thought that the use of heparinized blood or bicarbonate, recommended for the detrimental effects of citrated-blood exchange, is not necessary in general; it may be taken into consideration in special cases of premature infants of low weight where metabolic acidosis is present to begin with and the use of large amounts of blood is contemplated. All 13 references are Western.

AUTHORS: Bužek, Z., Hutla, A.

TITLE: Desulfuration in a vacuum

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 9, 1962, 11 - 12, abstract
9A60 ("Sb. vědec. prací Vysoké školy baňské Ostravě", 1961, v. 7,
no. 2, 245 - 246, Czech; summaries in Russian and English)

TEXT: The authors investigated desulfuration in a vacuum of metal with different S and C contents. It was found that the final S content did not depend upon the initial S content. Under the experimental conditions the S content was determined from the O content in the metal. On the basis of experimental results and literature data it is assumed that the mechanism of desulfuration in a vacuum can be represented in the following manner: elimination of S from pure Fe and steel takes place by evaporation. The evaporation process is favorably affected by increased S activity in the solution and reduced O content, predetermining the equilibrium of the S content. Desulfuration of cast iron containing Mn and Si in a vacuum proceeds mainly on account of the formation of a Mn-sulfide and graphite

mixture, and also SiS. These processes take place simultaneously to a different degree, depending on the experimental conditions.

"Leczenie hydrokortyzonem podawanym dostawowo gośćca pierwotnie przewlekłego. Treatment of rheumatoid arthritis with hydrocortisone acetate administered intraarticularly POL. ARCH. MED. WEWNĘT. 1955, 25/8a (1207-1228) Graphs 6 Tables 7

In 41 cases of rheumatoid arthritis 451 injections into 133 joints were given. The results were favourable especially when a single joint was affected. The improvement could be maintained with small doses, administered at large intervals. The intraarticular injections prevented the development of deformations and made possible an adequate rehabilitation therapy. A contraindication to intraarticular hydrocortisone therapy is bacterial infection of the joint to its environment.

EXCERPTA MEDICA Sec 9 Vol 13/8 Surgery August 59

4229. (1089) SYNOVIAL FLUID IN OSTEOARTHROPATHIA HYPERTROPHICANS PULMONALIS - Synoviálna tekutina pri osteoarthropathia hypertrophicans pulmonalis - Hüttl S. Výskumný Úst. Reumat. Chor., Pobožka, Písek - FYSIAT. VESTN. 1958, 36/5 (259-268) Tables 2

The composition of the normal and of some forms of pathological synovial fluid is given and an analysis of 6 specimens of synovial fluid from both knees in a patient suffering from hypertrophic pulmonary osteoarthropathy and cavitory tb is reported. The significance of this examination, particularly for the differential diagnosis with progressive chronic polyarthritis, the need to make the first analysis of the synovial fluid before commencing therapy, and the influence of treatment on the synovial fluid are discussed. In cases where a pure but rapidly coagulating synovial fluid is obtained the possibility of osteoarthropathia hypertrophicans pulmonalis should be considered and the primary disease, which is most frequently a malignant tumour and thus a great periculum in mora, should be sought for.

Reaction of sodium ferrocyanide with ferrous chloride in the presence of potassium salts. György Szilgyi and Jeno ~~Huttner~~ (Univ. Chem. Inst., Veszprém, Hung. ~~Magyar~~ ~~Chem.~~ ~~Ért.~~ ~~2~~ ~~311~~ ~~1968~~ ~~—~~ ~~Na₂[Fe(CN)₆] soln. was added to FeCl₂ soln. contg. various amts. of KCl. The white ppt. had a general compn. of (Na,K)₂₋₁₀Fe₇[Fe(CN)₆]; the exact compn. depended upon the FeCl₂:Na₂[Fe(CN)₆] ratio used. Any K⁺ present was incorporated into the ppt. instantaneously. Acid aging of the pigment was carried out by adding HCl in various amts. and allowing the ppt. to stand for various periods of time at 95°. By washing the ppt. in H₂O prior to acid aging and by oxidn. in the presence of K salts, a Na-free pigment could be obtained. In the course of aging, the alkali metal content of the ppt. approached or reached the (Na,K)₂Fe₇[Fe(CN)₆] compn.; the rate of this transformation increased with increasing amt. of acid used in the aging.~~

(Plasmodium vivax) During Natural Infections.

Orig Pub : Studii si cercotari stiint. Acad. RPR Fil. Iasi, 1955,
Ser 2, 6, No 1-2, 111-116

Abstract : In 8 patients with malaria caused by Pl. vivax, the
therapeutic and parasitocidal effect of chlorochin (I)
was tested; an average dose of 2.5 g during 3 days was
stipulated. Fever stopped the first day; schizonts dis-
appeared in 20-30 hours, hametocytes in 48 hours. In 8
hours after the administration of 1 g of the drug, ameboid

schizonts became orbicular, compact, and were colored more
intensively than usual. After the administration of 1.5 g
of I, degenerative changes of the nuclei were observed,
sometimes with peripheral expulsion. In large parasites,
especially in the female hametocytes, agglomeration of the
pigment and its expulsion from the cells was observed.
