carditis in Rotating Test Tubes

Orig Pub : Studii si cercetari inframicrobiol., microbiol.,
si parazitol., 1957, 8, No 1, 49-55

Abstract : The virus which was cultivated in the muscles
and skin of a mouse embryo was found to have a
cytopathogenic effect. The initial dilution of
the virus was $5 \cdot 10^{-5}$, the final-- $5 \cdot 10^{-10}$. By
titrating the virus of the final passage in the
brain of grown mice it was shown that the viru-
lence of the virus decreases, a fact which in the
opinion of the authors bears witness to the

Title : Preliminary Investigation to Determine the Degree of Mineralization of Ground Waters in the Embanked Territory Braila-Danube-Siret.

Orig Pub : Bul. stiint. Acad. RPR. Sec. biol. si stiinte agric. Ser. agron., 1957, 9, No 1, 29-39

Abstract : A study was conducted of the composition and magnitude of mineralization of ground waters, for the purpose of determination of their effect upon the soils. Waters with a mineralization of less than 2 g/liter are of the calcium bicarbonate type. Waters with a mineralization of 9-12 g/liter are of sodium chloride type; waters of median

Title : Agricultural-Soil Investigations in the Upper Basins of the Olt River

Orig Pub : An. Inst. cercetari agron., 1957, 24, No 5, 9-29

Abstract : The upper basin of the Olt River includes tributaries the Birsei, Gheorghe and Tirgu Secuiesc rivers. The conditions of soil formation are described. There are distributed here podzolic, brown forest, pseudo-rendzina chernozen, chernozen-like carbonated, and sandy weakly developed soils. The peculiarities of the distribution of these soils are discussed. A schematic map of the

1472. IANCU A. and NEULANDER A. Clin. de Ped. nr 1, Cluj. * Consideratii asupra particularitatilor reumatismului la copii in baza observatiilor Clinicii de pediatrie nr. 1 din Cluj. Particularities of rheumatism in childhood, on the basis of observations of the paediatric clinic nr. 1 at Cluj PROBL. REUMATOL. 1954, 2 (221-248)

In 72 cases the incidence was: 3-5 yr., 4.16%; 5-10 yr., 44.44%; 10-15 yr., 51.38%; sex: 48.61% boys, 51.38% girls. Admission during January-April 55.55%, May-August and September-December 22.22% each. In 61.11% unfavourable hygienic conditions were present. In 48.51% of cases, the parents had had arthritis or rheumatic fever, cardiopathies or nephritis. Tonsillitis has been present in 34.72%, inflammatory reactions of the joints in 11.11%, chorea in 2.77%, scarlatina in 4.16%, nephritis in 2.77%. Laboratory: leucocytes below 8,000/cu. mm. 36.11%; above 20,000/cu. mm. 5.55%. Haemoglobin below and above 70% in equal proportions of 50%. Tuberculin reaction positive in 8.33%. Examination of pharynx: Streptococcus viridans in 8.33%, haemolytic streptococcus in 11.11%, pneumococcus in 8.33% and mixed flora in 72.22%; tonsils affected in 87.50%; teeth affected in 6.94%. On leaving the hospital: ameliorated 86.10%, stationary 8.33%, aggravated 2.77%, exitus 2.77%.

curve in dystrophic infants caused by caffeine. I. Varia-
tions of the blood sugar curve in dystrophic infants
caused by administration of a single dose of caffeine
PEDIATRIA (București) 1956. 5/1 (76-81) Graphs 10 Tables 1

The method employed was that of establishing a conditioned reflex, consisting of an oculo-palpebral reflex following exposure to an air current and associated with either auditive or photic stimuli. At the same time the blood sugar curve was determined by using the Hagedorn-Jensen method. Initially 3 g. of glucose per kg were administered by the oral route to the fasting infant. The babies were divided into groups according to the ease with which the conditioned reflex could be established. Blood sugar curves were again obtained a week later after a subcutaneous dose of 0.04 g. of caffeine. Rise of blood sugar was found in babies with partial inhibitions (42-138 attempts to establish a conditioned reflex) and a fall in those with complete inhibition (over 200 attempts). Investigation with repeated doses of caffeine showed that blood sugar values depended both on the dose of caffeine as well as on the tone of the cerebral cortex. Holzcl - Manchester

1872. THE VALUE OF THE TAKATA-ARA AND THE TRYPTOPHAN TESTS IN THE CSF AND OF THE EXAMINATION OF THE OPTIC FUNDI IN THE EARLY DIAGNOSIS AND THE DIFFERENTIAL DIAGNOSIS OF TUBERCULOUS MENINGITIS IN CHILDREN - Valeur des réactions de Takata-Ara et du tryptophane dans le liquide céphalo-rachidien et de l'examen du fond de l'oeil dans le diagnostic positif précoce et différentiel de la méningite tuberculeuse chez l'enfant - Iancu A., Kontesveller L., Vonica C., Oncu V., Colesnicov C., Rusu M. and Schlezak L. Clin. de Pédi., Cluj, Roumanie - ARCH. FRANÇ. PEDIAT. 1958, 15/6 (823-834) Tables 3

In 47 cases of tuberculous meningitis it was found that the Takata-Ara test on the CSF was abnormal sooner and was a more sensitive test than the examination of the sugar and chloride contents. The tryptophan reaction was less sensitive than the Takata-Ara but was more reliable than the sugar and chloride levels. In contrast, among 77 non-tuberculous lymphocytic meningo-encephalitides the Takata-Ara test was negative in all and the tryptophan test was only slightly positive in 3. Both reactions were negative in 20 children with different types of non-meningeal tb. In 72% of 31 cases of tuberculous meningitis changes in the fundus oculi were observed.
