

ACCESSION NR: AP4033041

whence, using Equations (2) and (3), the following function is obtained:

$$\left(\frac{1}{E'U} + \frac{1}{E''U'} \right) - \frac{1 + U' + U''}{U'' - U'} \left(\frac{U'' - U}{E'U^2} - \frac{U' - U}{E''U'^2} \right) = 0. \quad (5)$$

Equations (2) and (5) provide the solution of the problem when D is given.
Several particular cases are considered in the concluding section of the paper.

TITLE: Vibrations of cylindrical shells in a acoustic medium

SOURCE: Ref. zh. Mekhanika, Abs. 3B262

REF SOURCE: Sb. Issled. po teorii plastin i obolochek. No. 3. Kazan', Kazansk. un-t, 1965, 218-225.

TOPIC TAGS: vibration, shell vibration, axisymmetric shell vibration

ABSTRACT: Forced axisymmetric vibrations of a cylindrical shell are considered with or without axial inertial forces and with a longitudinal instability of high-frequency of the combustion process. It is assumed that the edge of the flame is at the intake cross section and that hot gases are moving at a low subsonic flow along the entire length of the pipe. The wave equation for the velocity potential is solved by the method of division of variables in zero order of Bessel's function. It is considered that the acoustic impedances at the intake and exhaust end of a pipe are known. In satisfying the boundary condition on the wall of the potential in the expression for deflection, the terms describing the boundary effect are ignored. In con-

sidering the axial inertia forces the equation for shell vibration, the condition on the wall is satisfied on the average by the shell's length; moreover, it is shown that the axial inertial forces have no significant effect on the solution in the edge effect zone. [AM]

TITLE: Axisymmetric vibrations of a cylindrical shell under the effect of pressure variations

SOURCE: Ref. zh. Mekhanika, Abs. 5V190

REF SOURCE: Sb. Issled. po teorii plastin i obolochek. No. 3. Kazan', Kazansk. un-t, 1965, 196-203

TOPIC TAGS: cylindric shell structure, vibration analysis, axisymmetric vibration, deformation, gas flow

ABSTRACT: Axisymmetric vibrations are examined with consideration of longitudinal forces of inertia of two butt-connected heterogeneous cylindrical shells within which is a unidimensional gas flow separated by a discontinuity where the temperature, pressure, etc., experience a change. On the stationary flow of the stream are superposed the longitudinal disturbances

$$P_i(\xi, t) = P_i(\xi)e^{i\Omega t}$$

where $P_i(\xi)$ is the amplitude of the pressure; Ω is the audio frequency. Examining steady vibrations of a sectional shell in the form (u, w are longitudinal and transverse vibrations of the shells)

Card 1/2

ACC NR: AR6028084

$$u_i = U_i e^{i\Omega t}, w_i = W_i e^{i\Omega t}$$

the author solves the Love-Timoshenko equations for the case of axisymmetric deformation relative to $W_1(\xi)$. The author, eliminating from the examination the boundary zones, obtains expressions for the natural vibrations of the shell and for the function $W_1(\xi)$. The resonance values of the audio frequencies of the flow and the values of the Mach numbers corresponding to the resonance vibrations of the shells and gas-air channel are determined. TITLE: Free and parametric vibration of an infinite cylindrical shell in an acoustic medium

SOURCE: IVUZ. Aviatsionnaya tekhnika, no. 4, 1966, 41-50

TOPIC TAGS: shell vibration, cylindric shell vibration, free vibration, parametric vibration, cylindric shell structure, acoustic field

ABSTRACT: Simultaneous vibrations of an infinite elastic cylindrical shell and of a subsonic flow of a perfect gas through the shell are discussed, neglecting the effects of the surrounding medium. The fields of acoustic pressures and velocities in the gas are determined with regard to the interaction with the walls of the elastic shell. It is assumed that the displacements in the shell and the associated disturbances of the flow parameters are so small that the equations of motion can be linearized and that the tangential inertia forces in the shell are small as compared with the corresponding elastic forces. Equations of motion, of the normal force under free vibration, and of disturbances in an inviscid fluid are used in determining the wave numbers and frequencies of longitudinal (downstream and upstream) and radial waves. The effect of rigidity of the shell on the frequency of simultaneous vibrations of the shell and gas is discussed in detail. Parametric vibrations of a cylindrical shell produced by axisymmetric waves propagating downstream from a source in infinity

Card 1/2

Continuous excavating machines; design and construction (Zemleroynyye mashiny nepre-
ryvnogo deystviya; konstruktsii i raschety) Moscow, Izd-vo "Mashinostroyeniye,"
1965. 275 p. illus., biblio., tables. 3700 copies printed.

PURPOSE AND COVERAGE: The book describes the basic type of continuously operating
excavating machines, such as chain and rotor trench excavators, chain bucket
transverse excavators, open-cut excavators, elevating graders, as well as excavating
machines used in irrigation and reclamation construction. The discussion of design
includes determination of the basic parameters of machines, power values of drive
mechanisms, general statistical and dynamic calculations, and load conditions of
units and assemblies. The book is intended for engineering and technical personnel
of design offices and machine building plants. It may also be useful for students
of civil engineering and machine building. There are 54 references, of which 52
are Soviet.

TEXT: This is on the further development of the ultrasonic interferometer theory, which permits of doing without the simplifying assumption of the rear interferometer crystal wall being free. The electric impedance of the crystal is calculated in the presence of layers of finite thickness at either side of the crystal. It is shown that the electric impedance of the crystal can be expressed through the mechanical impedances of the boundary layers as follows:

$$Z = \frac{a^2}{4 e^2 s} \cdot (Z_{in} - Z_{ein}) ,$$

Card 1/2

Effect of the design of an ultrasonic

S/194/62/000/010/046/084
A061/A126

where Z_{e1n} denotes the mechanical input impedance of the left-hand electrode layer; Z_{in} denotes the mechanical input impedance of the flowing medium layer; a is the crystal thickness; e is the piezoelectric constant, and S is the crystal area. If the holder of the emitting crystal of the interferometer increases the active crystal losses, the relative change in the impedance value $|Z\omega_0|$ of the interferometer is reduced with a reflector shift, i.e., the interferometer sensitivity becomes poorer. A rigid crystal holder essentially increases the reactive component of the mechanical impedance of the interferometer, and produces asymmetry in the reaction curve. There are 10 figures.

TITLE: On ultrasonic velocity dispersion in magnetic fields

PERIODICAL: Referativnyy zhurnal, Fizika, no. 4, 1962, 37, abstract 4G313
("Kauno politechn. inst. darbai, Tr. Kaunassk. politekhn. in-ta",
1961, v. 14, no. 5, 9-17. Lith.; Russian summary)

TEXT: The authors carried out theoretical calculations of ultrasonic velocity in electricity-conducting liquids placed in a magnetic field, taking into account the thermodynamic and electric properties of these liquids. Calculations showed that viscosity and heat conductivity have but little effect on the value of ultrasonic velocity in a magnetic field as compared with the velocity in nonviscous and heat-conducting liquids. The effect of electric conductivity was evaluated. In the experimental part of their work, the authors describe measurements of ultrasonic velocity in mercury and sodium-potassium alloy (67% K) placed in a strong magnetic field (with induction of 21,000 gauss) at frequencies of 498 - 752 kc. Measurement results are shown in the form of curves. Measurements

TITLE: Precision interferometer for measuring ultrasound velocities in fluids in the frequency range 1 - 12 megacycles.

SOURCE: Akusticheskiy zhurnal, v. 10, no. 1, 1964, 54-59

TOPIC TAGS: interferometer, ultrasound velocity, crystal diameter, quartz crystal, reflector diameter, Pirs interferometer, impulse method, standing plane wave

ABSTRACT: The accuracy of velocity measurement by the described interferometer is $\pm 10^{-2}$ percent. The authors give the dependence of the measured ultrasound velocity in water on the ratio of the diameter of the crystal to the length of a sound wave in water, and also on the ratio of the reflector diameter to the wave length. They describe an interferometer of variable length, of Pirs type, with the ordinary indication (with the help of a pointer or a recording measuring device), which in accuracy not only exceeds that of an interferometer with the noted complicated means of indication but gives results close to the most perfect impulse method. Generally an interferometer is used in the presence of rather strict standing plane

Card 1/2

ACCESSION NR: AP4025730

waves with front parallel to the surfaces of the radiation crystal and the reflection waves with front parallel to the surfaces of the radiation crystal and the reflection. The authors touch upon the problem of using an interferometer for measuring ultrasound velocity also for lower frequencies, when there is a diffractional pattern for the sound field. The construction of this interferometer was done after thorough theoretical and experimental investigation of the oscillating properties of a crystal working in the complicated acoustical system of the interferometer. With precision interferometric measurements (with accuracy of about 0.01 percent) the true velocity of propagated plane waves is determined only when $d/\lambda \geq 50$. When $d/\lambda < 50$ it is necessary to consider the effect of diffraction on the measured value of the ultrasound velocity, and the diameter of the reflector must be of rather large dimensions in order not to multiply the diffractional effects. Verification for measured velocity values for $d/\lambda < 50$ may be determined by making measurements in undispersed fluids. When $d/\lambda < 13$ the velocity measurements cannot be made with this interferometer because of the large diffractional field distortion.

TITLE: Measurement of absorption of ultrasound in liquids by means of an interferometer

SOURCE: Akusticheskiy zhurnal, v. 12, no. 2, 1966, 258-261

TOPIC TAGS: ultrasound absorption, liquid property, interferometer, acoustic measurement, acoustic speed

ABSTRACT: The authors report that they were able to increase the sensitivity of interferometric measurements of the absorption of ultrasound in liquids by using new electric supply and indication circuits, mechanical fastening of the radiating crystal, and a new reflector construction (Fig. 1). This has made it possible to develop a new method of measuring absorption of ultrasound in liquids for frequencies 1 - 15 Mcs. Simultaneously, it makes it possible to determine the velocity of sound in the investigated liquid and the coefficient of reflection of the sound waves from the reflector. The absorption was measured with a precision interferometer of the Pierce type equipped with an adjustment for the parallelism of the reflector and the crystal, which radiated directly into the liquid. The theory of

Fig. 1. Block diagram of setup (left) and equivalent circuit (right). 1 - Quartz generator, 2 - broadband amplifier, 3 - high-frequency power amplifier, 4 - automatic amplitude control, 5 - interferometer chamber, 6 - cathode detector, 7 - dc amplifier, 8 - low-frequency oscilloscope, 9 - high-frequency oscilloscope, 10 - heterodyne wave meter, 11 - vacuum-tube volt meter.

the instrument and the calculation of the required corrections are briefly given. The accuracy of the method is approximately 10% at low absorption and 2.5% at high absorption. Test results are presented for water, acetone, ethyl alcohol, turpentine, carbon tetrachloride, benzene, acetic anhydride, and castor oil. Advantages claimed for the method are sensitivity adequate for the measurement of low absorption.

Blair (WB) medium. Tests were conducted on 194 samples of feces of typhoid or suspected typhoid and on 33 samples of recuperative or bacteria-isolating patients. Inoculations from enriched media were made 18-20, 48 hours, and 7 days after cultivation. In 51 positive cases, inoculations from MK medium were made in 5-8 hours. Altogether 90 positive results were obtained; from the medium with 0.4% sodium selenite, positive results were obtained in 91.1% of cases; from the medium with 0.2% sodium selenite in 87.7%, from MK medium in 74.4%, and from broth in 57.7%. Inoculation directly on WB medium produced 86.6% viability. Optimal period for cultivation on MK medium was 5-8 hours, on other enriched media 18-20 hours. The authors recommend inoculation on media

Title : Hemagglutination with Botulinus Toxin

Orig Pub : Microbiol., parazitol. si epidemiol., 1957, 2, No 3,
237-245 (Rumanian; res. Russ., Fr., Eng., Ger.)

Abstract : Botulinus toxin type A evoked hemagglutination, and the toxoid did not; therefore RHA must be utilized as a control in the process of rendering this toxin harmless with the aid of formalin. An attempt to utilize this reaction of delayed hemagglutination for titration of specific sera was undertaken. The authors consider that RHA could be applied for a control of nutritive products or pathogenic material for botulinus toxin with subsequent

Title : The Treatment of Schizophrenia with Serpasil

Orig Pub : Srpski arkhiv tselok. lekar., 1957, 85, No 9, 943-954

Abstract : 220 schizophrenic patients were treated with reserpine (R), sometimes in combination with electroshock. R produced a decrease of cessation of hallucinations and, in certain cases, of the autism and negativism. The best results were obtained in catatonia and depressive states. The combination with electroshock increased the effectiveness of the treatment; no complications were noticed. In patients with tuberculosis, R was improving both psychic and somatic conditions especially well. The symptoms of Parkinsonism developed in 33 patients who received only R, but were not observed even once in the combined treatment. These symptoms were remedied by artane without interrupting the treatment.

Abstract: The first impulse to establish a separate mental hospital in Serbia followed a well-publicized 1837 homicide by an insane, but political and other factors delayed opening to August 1861 with 12 patients which subsequent extremely rapid growth. Traditional overcrowding became especially critical during the Second World War when hospital became part of underground system for hiding the Jewish population from Nazis during simultaneous terrible famine and frightful mortality among patients; German occupiers once came by surprise and packed many of escapees into trucks to field gas chambers in Jasenac where everyone was killed; now the hospital is overcrowded again, hopes for expansion of means, services and facilities.

Control of *Bruchus pisorum* with hexachlorocyclohexane
Ilijadimir Ilijic (Inst. Protection Plant, Zemun, Yugoslavia)
Zashita Relya 1951, No. 5, 32 (French summary). Hexa-
chlorocyclohexane (I) used as the com. prepns., Agrocid
2 and Agrocid 7 dusts, gave excellent control of *B. pisorum*
on both lab. and com. scales. Agrocid 2 at the levels of
1 and 2 kg./metric ton, resp., controlled *B. pisorum* com-
pletely. Agrocid 7 gave excellent results, namely, 100%
and 99% at 1 kg./metric ton and 100% and 98% in 2
trials at 2 kg./metric ton. Peas treated in machines used
for dusting wheat with fungicides were free from insect in-
festation after one-month storage. Agrocid kills both as a
contact insecticide and as a fumigant but kills more quickly
as a contact insecticide. The dosage which on contact
paralyzed adults in 10-30 min. and killed in 18 hrs. re-
quired 3 days to kill as a fumigant (temp. 22 to 24°).
Acanthoscelides obtectus was more susceptible to I than
was *B. pisorum*. Nellie M. Payne

Title : An Installation for Wool Dyeing.

Orig Pub: Tekstilna ind., 1957, 5, No 12, 421-424.

Abstract: Review of modern installations and apparatus for wool dyeing. The dependency of apparatus employed on the dye type and the nature of fibre (such as natural wool, artificial and synthetic fibres) is indicated. The "PAK" system for the drying of wool (including several alternates) and several other continuous installations are described.
