Title : New Data on Gallflies and Galls in Rumania.

Orig Pub: Bul. stiint. Acad. RPR, Sec. biol. si stiinte
agric, 1956, 8, No 4, 775-788.

Abstract: Species of galls of the gallflies Andricus aco-
tivalis and Neuroterus (Pseudoneuroterus) macrop-
terus, new for Rumania, were discovered. There
were found also the commensals (males and females),
Periclistus caninae, in the galls of the species
Diplolepis spinosissima, and Synergus thumacora
in the galls of Trigonaspis synapsis.

"Quantitative Uroculture."

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 8, No 1, Jan-Feb 1963, pp 87-90.

Abstract: Describes a new method for quantitative uro-culture, which is superior to the classical methods in the sense that it can differentiate better between positive, false positive, and negative cultures. The method is simple and does not require excessive amounts of culture media or any materials that are hard to obtain. The complete results can be obtained in 48 hours, as with the classic methods, and are easily interpretable by clinicians.

Includes 2 tables and 8 Western references.

Pre-operative radiotherapy followed by wide lymphadeno-colpohysterectomy gives the least number of recurrences in the stages I and II. A study was made of 137 cases of recurrence; 15.3% occurred after treatment of incipient stages and 84.7% after advanced stages. The following types are distinguished: (1) 'incipient recurrence' when the lesion is small and permits mobilization of the vaginal dome with the adjacent parametrium; (2) 'advanced recurrence', with pronounced infiltration and immobilization of the vaginal dome. A careful monthly control associated with cystoscopy and rectoscopy for detecting 'incipient recurrences' which can benefit from treatment, is necessary. In 137 cases, 108 times parametrial recurrences were found and 101 times recurrence in the vaginal stump. The greater part of the parametrial recurrences (60%) occurred in the first 6 months. In a number of cases the 'recurrence' was rather a postoperative course of a pre-existing neoplastic infiltration, for the simple clinical diagnosis of the stage without histopathological examination, remains insufficient to define the actual stage precisely.

Title : Chemico-Technological Study of Peat in RFR. Report II. Mechanical Treatment and Processes of Chemico-Technological Treatment of Peat in RFR.

Orig Pub: Studiul de cercetari chimice, 1956, 6, No 3, 265-279.

Abstract: It was found in the laboratory study of briquetting that the strength of briquets does not increase noticeably with the rise of pressure above 1500 kg

Card : 1/2

106

per sq. cm. The optimum moisture in peat, producing strongest briquets depends on the granulometric composition of peat and changes together with it. The temporary resistance to bending of briquets produced was 27 - 36 kg per square 5% cracks or more was produced, when briquets were dropped from a height of 3 m on a cement floor. The briquets disintegrated when immersed in water. In the carbonization of peat with a mixture of alcohol and benzene (1 : 1), the yield of combustible mass varied between 3.8 and 18.5% of the sample. 1971. 62203 for Report I. - N. Ionescu.

TITLE : On the Mechanical Concentration of Lignites

ORIG. PUB. : Rev Minelor, 9, No 2, 82-87 (1958)

ABSTRACT : The authors report on the testing of three processes for the concentration of Rumanian brown coals: separation according to particle size of brown coals and semicoke, separation in high-density organic solutions, and separation in high-density aqueous suspensions. The authors note that for the coals tested separation according to particle size is insufficient and the application of gravity-concentration methods is necessary.
