The diagnostic value of the two-dose glucose tolerance test. T. S. Gal'perina and L. Ya. Olefnik (Moscow Med. Stomatol. ~~Journal~~ *Med.* (U.S.S.R.) 31, No. 3, 30-7 (1953).—Several modifications were investigated. With the 30-20 g. dose, a 1-hr. interval was tried on 3 normal and 44 nondiabetic pathol. casts. The hypoglycemic effect at the end of the tests was inconclusive. The 50-50 g. dose, 1-hr. interval, was equally inconsistent. Attempts to lengthen or shorten the interval to 1 1/4-2 1/4 hrs. did not yield better results. The largest percentage of hypoglycemic effects was obtained with the 1 1/4-hr. interval. The multiple dose was tried next; 6 patients received 20 g. 9 times at 30-min. intervals, 10 patients 20 g. 4 times at 30-min. intervals and 100 g. after 3 hrs. The multiple dose yielded the largest no. of hypoglycemic effects. Apparently factors other than the insulin-excreting function of the pancreas influence the glycemic curve resulting from glucose satn.

Gal'pern, D. Yu. Geometrical optics in anisotropic media with a single axis of symmetry. (Uniaxial crystals.) 2. 1 - P/7
Tehn. Fiz. 24, 1298-1321 (1954). (Russian)

A method based on Fermat's principle is described for finding the path of a ray through an optical system containing uniaxial crystals. The properties of the derivatives of the angular, mixed, and Schwarzschild eiconals are investigated at some length. These basic results are applied to the study of the behavior of infinitely narrow meridional and sagittal pencils in systems with a meridional plane. For this problem the connection is shown between focal distances, sagittal as well as meridional, in the object and image spaces, and formulas are derived analogous to Newton's formulas for linear and angular magnification. The basic formulas are also used to derive the laws of reflection and refraction at the boundary between two uniaxial crystals. The results obtained are greatly simplified if the incident ray, the normal at the point of incidence, and the axis of the first crystal are coplanar. If the axis of the second crystal is also coplanar with these, the study of the astigmatism of infinitely narrow pencils becomes possible without any excessive complexity in the formulas. Applications of the general method are given to the case of prisms and to the

AUTHOR: Galpern, D. Yu.

TITLE: On the Application of Higher Order Aberration Theory to the Calculation of Optical Systems (O prilozhenii teorii aberratsiy vysshikh poryadkov k raschetu opticheskikh sistem)

PERIODICAL: Optika i Spektroskopiya, 1957, Vol.III, Nr 5, pp.514-528 (USSR)

ABSTRACT: On the basis of higher order aberration theory a number of general propositions which are important in the calculation of optical systems is established. The question of the number of lenses and nonspherical surfaces in an optical system necessary (but not sufficient) for the correction of all aberrations of order $2t + 1$ or less, is elucidated. The role of coefficients of aberration of order $2t - 1$ or less in the appearance of aberrations of order $2t + 1$ is considered, particularly the role of third order aberrations in the appearance of fifth order aberrations. The paper is highly mathematical.

Telescopes in Modern Geodetical Instruments (Zritel'nyye truby sovremennykh geodezicheskikh priborov)

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Geodeziya i aerofotos"yemka, 1959, Nr 1, pp 91-94 (USSR)

ABSTRACT:

The object lenses of telescopes in modern geodetical instruments are telephoto lenses. This ensures very important technical properties of the instruments but leads simultaneously to great difficulties in the computation and manufacture of telescopes. Great difficulties arise in the correction of chromatic aberrations. Chromatic aberrations of rays spreading in the paraxial range, and then the spherochromatic aberration are investigated here. The theoretical investigations and the experience of practical computations show that for the correction of the spherochromatic aberration some surfaces of the system must inevitably have a strong curvature. These offer difficulties in the manufacture. - Due to such deliberations, the computation of a telescope with the same characteristics as for the telescopes of the instruments TB and KB was carried out in 1955.

Card 1/2

Telescopes in Modern Geodetical Instruments

SOV/154-59-1-9/19

The computed values of the spherochromatic aberration of the new telescope amount to half the aberration of the telescope of the two instruments TB and KB. - In spite of this, no telescope has been made according to this computation up to date. It is also pointed out that the quality of the pictures is not only determined by the computation but also by a careful assembly and manufacture of the individual structural groups. - H. Koehler (Ref 1) pointed out that the chromatic aberration for rays with the wave length = 434μ attains high values in many telescopes. He succeeded in reducing this value down to $10' - 15'$. - Telescopes with a correction of the aberration for the wave length of 434μ will be computed in 1958. This system will then be compared with the telescope computed in 1955, and the question of an economical correction of the aberration for telescopes of geodetical instruments will be solved. There are 1 figure, 1 table, and 1 reference.

TITLE: F.I. Fedorov. Optics of Anisotropic Media. Academy of Sciences of the Byelorussian S.S.R., Minsk, 1958. (F.I. Fedorov. Optika anizotropnykh sred. Izdaniye AN BSSR, Minsk, 1958)

PERIODICAL: Optika i Spektroskopiya, 1959, Vol 6, Nr 5, pp 714-715 (USSR)

ABSTRACT: The above monograph by Fedorov starts with Maxwell's and constitutive equations and uses them to discuss propagation of plane waves in an infinite medium as well as reflection and refraction of plane waves at plane boundaries of two infinite media. The monograph deals consecutively with propagation of light in an isotropic non-conducting and non-magnetic medium, in anisotropic non-conducting and non-magnetic medium, an an isotropic conducting and non-magnetic medium and finally in an anisotropic conducting and non-magnetic medium. The special feature of the monograph is that Fedorov discusses the subject using vectors and tensors which are not bound up with any particular system of coordinates. After minor criticisms the reviewer recommends the book to all those who want to study electro-magnetic optics seriously, and the first chapter is recommended to beginners in physical optics.

TITLE: On apodization

PERIODIC Optika i spektroskopiya, 1960, Vol.9, No.4, pp.549-550

TEXT: The present note deals with apodization, i.e. with methods of decreasing the diameter of the central diffraction spot (Airy's disc) in the image of a luminous point. This can be done with the aid of an amplitude-phase filter in the form of suitably shaped glass plate with appropriate transmissions at various points along the plate. It is known (Ref.1: G.G.Slyusarev, GITL, M., tr.667-671, 1937) that in the paraxial position, the intensity distribution $E(\rho)$ in the image of a luminous point is given by

$$E(\rho) = \sqrt{C^2(\rho) + S^2(\rho)}. \quad (1)$$

where

$$S(\rho) = \int_0^{\sigma_{\text{np.}}} A_1(\sigma) \sin \left[\frac{2\pi}{\lambda} l(\sigma) \right] J_0 \left(\frac{2\pi}{\lambda} \sigma \rho \right) \sigma d\sigma, \quad (2)$$

$$C(\rho) = \int_0^{\sigma_{\text{np.}}} A_1(\sigma) \cos \left[\frac{2\pi}{\lambda} l(\sigma) \right] J_0 \left(\frac{2\pi}{\lambda} \sigma \rho \right) \sigma d\sigma. \quad (2a)$$

Card 1/2

On apodization

33020 R
S/051/60/009/004/034/034
E032/E414

It is shown in the present paper that when $\ell(\sigma) < \frac{1}{4}\lambda$ and $A(\sigma) > 0$ i.e. when it is assumed that the wave aberration is less than a quarter of the wavelength, a filter of the above type cannot reduce the size of the central diffraction disc by a factor greater than 1.6. There is 1 Soviet reference.

TITLE: On the breakdown of one-to-one correspondence between image and object

PERIODICAL: Optika i spektroskopiya, v.13, no.1, 1962, 124-128

TEXT: It is shown that different series of different (self-luminous and non-selfluminous) objects will, under certain conditions, produce rigorously identical images. It follows that in general it is not possible to use a known image to reconstruct the distribution of luminance or the amplitude distribution in the object plane. Strictly speaking, this does not contradict the results of B.S. Tsybakov and V.P. Yakovlev (Izv. vysshikh uch. zav., Radiofizika, v.1, no.5-6, 1958) and H. Wolter (Opt. Acta, 7, 1960, 53) since these workers assumed the object to be finite. The present analysis is based on a re-examination of the theorems of V.S. Ignatovskiy (Izv. AN SSSR, Otd. mat. i yestestv. nauk, series VII, no.6, 1935, 729) who considered infinite objects. These theorems thus turn out to apply to coherent objects also, and the fact that they hold rigorously for infinite objects only
Card 1/2

On the breakdown of one-to-one ...

S/051/62/013/001/012/019
E032/E114

does not impose a stringent limitation because, for example, the field of view of a microscope is of the order of 1000-1500 optical units. The general conclusion is that periodic components in the expansion of the function describing the luminance or amplitude distribution in the image plane give rise to a uniform background when the period is less than π units in the case of non-coherent objects, and less than 2π units in the case of coherent objects.

ABSTRACT: This Author Certificate presents an objective for geodetic telescopes with internal focusing. The device consists of a positive four-lens component² and a simple negative focusing lens (see Fig. 1). To correct spherochromatic aberration, the positive component is in the form of two individual lenses separated by a distance of 0.1-0.2 of the focal length of the positive component and a double cemented meniscus lens with a linear magnification of 0.4-0.8.

TOPIC TAGS: photographic lens, Petzval lens

ABSTRACT: This Author's Certificate introduces an apochromatic Petzval lens made up of two positive elements, each of which is combined with a negative element placed behind the positive element and separated from it by an air gap. Correction for spherochromatic aberration is provided by two meniscus elements, one negative and the other positive, with the concave surface facing the image. This compound correction system has a positive power and is located behind the first four lenses.

TITLE: Estimate of frequency-contrast characteristic with the aid of the Rayleigh criterion

SOURCE: Optiko-mekhanicheskaya promyshlennost', no. 7, 1966, 22-26

TOPIC TAGS: optic system, image contrast, light aberration, photographic lens, light diffraction

ABSTRACT: The author presents a method of estimating the frequency-contrast characteristic of an optical system from the transverse geometrical aberrations, for periods which are approximately ten times larger than the limiting period. The estimate is based on a principle similar to the Rayleigh criterion whereby a wave aberration by one quarter of a wavelength is admissible. The existence of a similar criterion for the frequency-contrast characteristic is first proved by the standard vector-addition technique and its applicability region is then estimated and illustrated with numerical examples. The results lead to an estimate, based on the calculation of the ray path and the construction of aberration plots, of a frequency-contrast characteristic for frequencies which are 10 - 20 times smaller than the limiting values. The method presented in the article makes it possible to establish the permissible transverse aberrations for photographic and projection lenses whose actual resolution limit is

TITLE: A nonocular optical system for observation and sighting. Class 42, No. 191162

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 3, 1967, 107

TOPIC TAGS: optic instrument, telescopic equipment, optic detection

ABSTRACT: This Author's Certificate introduces a nonocular optical system for observation and sighting. The installation contains an objective lens, a compound erecting lens and a collector in direct proximity to the image surface. Correction for the curvature of the image surface is provided by using a negative and a positive component in the erecting lens. The negative component is used for matching the entrance pupil of the erecting lens to the exit pupil of the objective lens and has a power 20% greater in absolute value than the combined power of the other components.

Title : Application of flat metallic supporting structures
Periodical : Elektrichestvo, 12, 57-61, D 1954
Abstract : The authors consider as advisable the use of such structures for 35-kv transmission lines. They develop a method of determining additional forces in unbroken conductors at symmetrical and asymmetrical breaks. They examine the performance of the transmission line when a wind is directed along the line. 11 photographs, drawings and diagrams. Four Russian references (1, 1928; 3, 1947-1952).

GALPERN, S.

Halpern, S. Sur les asymptotes des solutions de l'équation $y' = f(x, y)$. C. R. (Doklady) Acad. Sci. URSS (N.S.) 54, 383-386 (1946).

The author demonstrates the following theorem: Suppose that in the semi-strip $x \geq \alpha, \beta - m \leq y \leq \beta + m$ the following conditions are satisfied: (1) $f(x, y)$ is continuous; (2) the equation $f(x, y) = 0$ determines a continuous curve $y = b(x)$ which for $x \geq \alpha$ lies in the strip and has the line $y = \beta$ as an asymptote; (3) there exists a function $x = \omega(y)$, continuous and monotonic in the intervals $\beta - m < y < \beta$ and $\beta < y < \beta + m$ such that curves representing $x = \omega(y)$ lie in the semi-strip and such that $\omega(\beta - 0) = \omega(\beta + 0) = +\infty$; moreover, for each fixed value of y , $\inf_{x > \omega(y)} |f(x, y)| \geq K(y) > 0$, where $1/K(y)$ is an integrable function in any segment not containing the point β . If $f(x, y)$ is negative above $y = b(x)$ and positive below then each solution of $y' = f(x, y)$ having one point in the semi-strip has $y = \beta$ as asymptote. The author also considers the situation when $f(x, y)$ has opposite signs from those indicated. N. Levinson (Cambridge, Mass.).

1- F/7

This paper considers explicit representations for solutions of

$$(\partial/\partial t)^2 \Delta u = -(\partial/\partial x_n)^2 u + f(t, x_1, x_2, \dots, x_n)$$

with initial conditions

$$u = \phi \text{ when } t=0, (\partial u/\partial t) = \psi \text{ when } t=0.$$

Here Δu denotes the n -dimensional Laplacian of u ,

$$\Delta u = [(\partial/\partial x_1)^2 + (\partial/\partial x_2)^2 + \dots + (\partial/\partial x_n)^2]u.$$

It is proved that solutions of this initial-value problem are unique, and that every sufficiently smooth solution can be represented in the form

$$u(t, x_1, \dots, x_n) =$$

$$\int \Delta^s \phi(\xi_1, \dots, \xi_n) H^{(s)}(t, x_1 - \xi_1, \dots, x_n - \xi_n) d\xi_1 \dots d\xi_n,$$

provided one first reduces to an equivalent problem where $\psi=0$. Here s is an integer which must be chosen in a suitable way, and an explicit expression is given for $H^{(s)}$, obtained by inverting the order of integration in a Fourier transform. Both the uniqueness and the repre-

15

300

GAL'PERN, S.A.

sentability follow from Green's formula, provided one has a suitable fundamental solution. Such a fundamental solution is obtained by means of the Fourier integral. This generalizes a result of Sobolev [Izv. Akad. Nauk SSSR. Ser. Mat. 18 (1954), 3-50; MR 16, 1029] who dealt with the case $n=3$.

AUTHOR: Gal'pern, S.A. (Moscow) 20-119-4-4/59
 TITLE: Cauchy's Problem for General Systems of Linear Partial Differential Equations (Zadacha Koshi dlya obshchikh sistem lineynykh uravneniy s chastnymi proizvodnymi)
 PERIODICAL: Doklady Akademii Nauk SSSR, 1958, Vol 119, Nr 4, pp 640-643 (USSR)
 ABSTRACT: Let the system

$$(1) \quad \frac{\partial}{\partial t} \left[M \left(t, \frac{1}{i} \frac{\partial}{\partial x_k} \right) \right] u' = L \left(t, \frac{1}{i} \frac{\partial}{\partial x_k} \right) u$$

be given, where x_k denotes the arguments x_1, \dots, x_n , M and L are quadratic polynomial matrices with respect to the operations $\frac{1}{i} \frac{\partial}{\partial x_k}$ and possess coefficients depending on t , and u is the sought vector function with N components. Let the initial conditions be

$$(2) \quad u(t_0, x_k) = \varphi(x_k) .$$

Let the coefficients of (1) be continuous functions of t .

Card 1/3

Cauchy's Problem for General Systems of Linear Partial Differential Equations 20-119-4-4/59

$t_0 \leq t \leq T$. After the Fourier transformation

$$v_i = \frac{1}{(2\pi)^n} \int u_i e^{-i(\alpha, x)} dx_1 \dots dx_n, \quad (\alpha, x) = \sum_{k=1}^n \alpha_k x_k$$

one obtains

$$(3) \quad \frac{d}{dt} [M(t, \alpha_k) \bar{v}] = L(t, \alpha_k) \bar{v}$$

The functions $\bar{v}^1 = (v_1^1, v_2^1, \dots, v_N^1)$ are assumed to form the fundamental system of solutions of (3), whereby it is

$$\|v_i^1\|_{t=t_0} = E.$$

Theorem: If $\|v_i^1\|$ is bounded for all α and $t_0 \leq t \leq T$ and for $\alpha \rightarrow \infty$ does not increase quicker than α^p , $p > 0$, then the formulas

AUTHOR: Gal'pern, S.A.

TITLE: Cauchy's problem for a general system of linear equations with partial derivations

SOURCE: Moskovskoye matematicheskoye obshchestvo. Trudy, v. 9, 1960, 401 - 423

TEXT: The results of this article were reported to the Moscow Mathematical Association on May 20, 1958. The author states the basic case of Cauchy's problem for a system of partial differential equations in the variables $(t, x_1, x_2, \dots, x_n)$. Cauchy's initial conditions are

$$u(t_0, x_k) = \varphi(x_k). \quad (2)$$

In the case of homogeneous equations the basic system may be written in matrix form

$$\frac{\partial}{\partial t} \left[M(t, \frac{1}{i} \frac{\partial}{\partial x_k}) u \right] = L(t, \frac{1}{i} \frac{\partial}{\partial x_k}) u \quad (1')$$

Card 1/7

30006

S/550/60/009/000/005/008

D251/D305

Cauchy's problem for a general ...

where $(t, \frac{1}{i} \frac{\partial}{\partial x_k}) = L_1(t, \frac{1}{i} \frac{\partial}{\partial x_k}) - \frac{\partial}{\partial t} M(t, \frac{1}{i} \frac{\partial}{\partial x_k})$. The coefficients of (1') are assumed to be continuous complex functions of the real variable t where $0 \leq t \leq T$. Applying a Fourier transformation and simplifying, gives

$$M(t, \alpha_k) \frac{dv}{dt} = L_1(t, \alpha_k). \quad (3')$$

After establishing some basic lemmas, the author states and proves the following existence theorems, using the methods of Bochner (Ref. Fouriesche Integrale, 1932). Theorem 1: If the terms of the fundamental matrix $//v_i^l//$ of the system (3') satisfies the conditions

$$//v_i^l// \leq \frac{A}{|\alpha|^q}, \quad q \geq 0 \quad (A_1)$$

for $|\alpha| \leq 1$ and $0 \leq t_0 \leq t \leq T$ and

$$//v_i^l// \leq A/|\alpha|^p, \quad p > 0 \quad (A_2)$$

Card 2/7

30006

S/550/60/009/000/005/008

D251/D305

Cauchy's problem for a general ...

for $\alpha > 1$, then the formula

$$u_1 = \int \sum_{i=1}^N v_i E \varphi_i e^{i(\alpha x)} d\alpha_1 \dots d\alpha_n \quad (12)$$

gives the solution of the problem (1') - (2) if the initial functions φ_i satisfy the following conditions: a_1) all moments from i up to the order $\eta = q - n + 1$ exist and equal zero up to $\eta - 1$, i.e. ✓

$$I_{s_1, \dots, s_n} = \int (x_1)^{s_1} \dots (x_n)^{s_n} \varphi_i(x_k) dx_1 \dots dx_n = 0 \quad (13)$$

for all integral $s_k \geq 0$ such that

$$\sum_{k=1}^n s_k \leq \eta - 1, \quad |I_{s_1, \dots, s_n}| \leq A$$

Card 3/7

Cauchy's problem for a general ...

with $\sum_{k=1}^n s_k = \eta$; a_2) the function φ_1 together with derivatives of order $[\frac{n}{2}] + p + k + 1$ belong to $L_{1,2}$. Here and henceforth is the order of the highest derivatives in the operators

$$M(t, \frac{1}{i} \frac{\partial}{\partial x_n}) \quad L(t, \frac{1}{i} \frac{\partial}{\partial x_k}).$$

Theorem 2: Let l_1, \dots, l_n be non-negative integers, k as defined above, and u the solution of (1') - (2) then the expression

$$x_1^{l_1} x_2^{l_2} \dots x_n^{l_n} D^{k_0} u, \text{ where } l_1 + \dots + l_n \leq L, \text{ and } k_0 \leq k \quad (21)$$

belongs to $L_{1,2}$ if (1) conditions (a_1) and (a_2) of Theorem 1 are satisfied [Abstractor's note: A is written for a in the text in both cases] (2) $M(t, \alpha_k) = \alpha/c (\alpha_0 + \dots + \alpha_g/\alpha/B) \neq 0$ or $\alpha \neq 0$. Also
Card 4/7

TITLE: Lacuness of Non-hyperbolic Equations \o

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 5,
pp. 990 - 993

TEXT: The domains of the plane $t = 0$ in which the values of the initial data have no influence on the value of the solution in the point M are denoted as lacunes. In the case of hyperbolic equations the existence of lacunes has been investigated by J. G. Petrovskiy (Ref.1), V. A. Borovikov (Ref.2) and others. The author gives a class of non-hyperbolic equations with lacunes. The simplest equation of this kind is

$$(1) \quad \frac{\partial^2 \Delta u}{\partial t^2} = \sum_{i=1}^n \frac{\partial^4 u}{\partial x_i^4}$$

A more complicated example is given by the equations

$$(3) \quad Q \left(\frac{\partial}{\partial t}, \frac{\partial}{\partial x_1}, \dots, \frac{\partial}{\partial x_n} \right) u = 0,$$

Card 1/2

AUTHORS: Gal'pern, S.A.; Kondrashov, V.Ye.

TITLE: Cauchy problem for a differential operator decomposing into wave factors

SOURCE: AN SSSR. Doklady*, v.154, no.4, 1964, 757-759

TOPIC TAGS: cauchy problem, wave equation, differential operator, differential equation, partial derivative, mathematical physics, plane wave

ABSTRACT: This work is devoted to the Cauchy problem for the equation

$$\mathcal{L}u \equiv \prod_{k=1}^l \left(\frac{\partial^2}{\partial t^2} - \frac{1}{a_k^2} \Delta \right)^{r_k} u(x, t) = 0, \quad (1)$$

where

$$a_1 > a_2 > \dots > a_l > 0; \Delta = \sum_{j=1}^n \frac{\partial^2}{\partial x_j^2}; x = (x_1, \dots, x_n).$$

Let $2m$ be the order of equation (1); $m = r_1 + r_2 + \dots + r_l$. The in-

Card 1/3

ACCESSION NR: AP4012958

Initial conditions are such that

$$\left. \frac{\partial^s u}{\partial t^s} \right|_{t=0} = f_s(x), \quad s = 0, 1, \dots, 2m - 1. \quad (2)$$

The solution to this equation can be obtained if the solution to the problem with such initial conditions is such that

$$\left. \frac{\partial^s u}{\partial t^s} \right|_{t=0} = 0, \quad s = 0, 1, \dots, 2m - 2, \quad (3)$$

$$\left. \frac{\partial^{2m-1} u}{\partial t^{2m-1}} \right|_{t=0} = f(x), \quad s = 2m - 1.$$

are known. In the case where $r_1=r_2 = \dots = r_{2m-1}=1$, the solution can be obtained by means of the classical Herglotz-Petrovskiy formulas for a homogeneous and strictly hyperbolic equation. It is of some interest to obtain formulas for solving the problem through the spherical means of the initial functions, i.e. formulas which are analogous to the generally known formulas, yielding a solution to the Cauchy problem for a wave equation. The authors obtained such formulas for the solution of (1) with unrestricted r_k . These formulas help to determine precisely the degree of smoothness of the initial functions. They are also useful in solving the problem of the nature of the

Card 2/3

ACCESSION NR: AP4012958

relationship of a solution to the equation in the apex of the characteristic cone to the values of the initial functions in each of those domains on which the surface of the characteristic cone lays out the plane of the initial data, i.e. when some of these domains will be gaps or weak gaps. The Cauchy problem with initial conditions of the general form (2) can be reduced to a Cauchy problem (3) and solution of the problem (2) is a linear combination of solutions of the type (3) and their derivatives with respect to t . Orig. art. has: 5 equations.

Title : Investigation of the Dependence of the Dielectric Constant and the Tangent of the Dielectric Loss Angle of Barium Titanate on the Intensity of the High Frequency Electric Field.

Orig Pub : Zh. eksperim. i teor. fiziki, 1956, 30, No 4, 675-680

Abstract : A method is described for the investigation of the dependence of the dielectric constant and the tangent of the dielectric loss angle of barium titanate on the electric field intensity at various temperatures with the aid of a measuring circuit, containing a linear variable capacitor, whose rotor is driven by electric motor at 1,500 rpm. During one half of the period, the capacitance varies linearly, and during the second half it diminishes. Over this cycle, upon suitable choice of parameters, the circuit is twice in resonance with the generator, and the resonance is fixed on the oscillogram in the form of two resonance curves. By connecting

Abstract : the tested capacitor in parallel the peaks of the resonant curves are shifted by an amount proportional to the capacitance connected; the shift serves as a measure of this capacitance. Heating of the specimen upon application of a high field (up to 3.2 kv/cm) is prevented by the short time of application of the high frequency field (0.1 seconds). The maximum error in the measurement of capacity is estimated at 2%, and in the measurement of the tangent of the loss angle at 25%.

The tangent of the dielectric loss angle is determined by the method whereby the circuit is detuned as the voltage is measured with a vacuum tube voltmeter.

It is shown that the non linearity of $C = f(E)$, the temperature behavior of the capacitance, and the tangent of the loss angle for barium titanate at high frequency and in strong fields all have a character analogous to that observed in weak

Abstract : fields. At a frequency of 1 Mc the capacitance is less and the nonlinear properties are less strongly pronounced than at a frequency of 50 cycles. In addition, the tangent of the loss angle depends weakly on the field intensity. A more pronounced manifestation of the nonlinear properties of barium titanate in the region of the Curie point is attributed by the authors to the fact that the rotation of the moments under the influence of the external field is facilitated in this region.

TITLE: The Determination of Inductance Defects in Loading
Coils of Communications Cables (Opredeleniye braka po
induktivnosti v katushkakh pupinizirovannykh kabeley
svyazi)
PERIODICAL: Vestnik Elektropromyshlennosti, 1959, Nr 4, p 68 (USSR)
ABSTRACT: In manufacturing communications cables with loading coils
it is important that the inductance of the loading coils
should be right, and in particular inductances of
different coils should not differ by more than $\pm 1.5\%$.
Coils of the wrong inductance are usually located by
bridge methods but in some cases this is not convenient.
This article proposes a new method of inspecting for
inductance which is of more general application and which
also can reveal which of the loading coils at the line
ends is the cause of trouble. An audio-frequency genera-
tor and valve volt-meter are connected to one end of the
line. The generator is tuned to resonance frequency
which is recognised by the valve voltmeter readings.
Card 1/2 Since the cables capacitance is usually known, and in any
case measured, the inductance can be determined from the

resonant frequency. If there are loading coils at each
end of the line the test is made from each end in turn
and then the defective coil can easily be located. The
method has proved effective and economical in service.
There are 1 figure and 2 Soviet references.

TITLE: Temperature dependence of the dark electric conductivity
of stilbene B

SOURCE: Fizika tverdogo tela, v. 6, no. 12, 1964, 3750-3751

TOPIC TAGS: stilbene, electric conductivity, dark current, tempera-
ture dependence, activation energy, solid phase, liquid phase

ABSTRACT: This investigation was stimulated by the lack of published data on the conductivity of bulk stilbene. In view of the brittleness of stilbene single crystals the measurements were made with polycrystals made from single crystals to ensure purity. The procedure is briefly described. An electrode system with a guard ring was used to determine the volume current. The sample was heated at a rate of 10--15 deg/hr and kept at constant temperature for about

2
a half hour before each measurement. The temperature was kept constant within 0.1°. The stationary current was measured with a vacuum-tube electrometer at an external field intensity $\sim 10^3$ V/cm. The results for two samples are shown in Fig. 1 of the enclosure. The average values obtained for the conductivity and for the thermal activation energy are $(2.0 \pm 0.5) \times 10^{-2}$ ohm⁻¹ cm⁻¹ and 1.70 ± 0.05 eV, respectively. Measurements were also made of the electric conductivity of stilbene near the melting point and in the liquid state. The conductivity of the liquid is approximately 300 times higher than that of the solid. Supercooling of liquid stilbene was observed. "The authors thank N. N. Spendiarov for growing the single crystals and for many valuable hints." Orig. art. has: 1 figure.
