TITLE: Concerning the calculation of electrostatic electron-optical systems with  
correction of astigmatism /Report, Fifth All-Union Conference on Electron Microscopy  
held in Sumy 6-8 July 1965/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 5, 1966, 735-738

TOPIC TAGS: electron optics, electrostatic field, aberration, optic resolution

ABSTRACT: This paper is based on earlier work by P.P.Kas'yankov and collaborators  
(Zh. tekhn. fiz., 22, 80 (1952)); Izv. AN SSSR. Ser. fiz., 27, 9, 11'7 (1963)); Optiko-  
mekhanicheskaya promyshlennost', 11 (1964)) on the calculation of electron-optical  
systems with correction of different third order aberrations; notation and formulas  
from the earlier work are used freely without redefinition or derivation, and the  
present paper cannot be understood without reference to the earlier papers. In the  
earlier work an auxiliary function whose integral along the optic axis from the object  
point to the image point vanishes was used to reduce the calculation of the system to  
the solution of a set of ordinary differential equations. In the present paper there  
are briefly discussed two different designs that arise from different choices for the

Card 1/2

L 36996-66

ACC NR: APG0157<sup>5</sup>X3

auxiliary function. The auxiliary function, which in both cases involves disposable parameters, is written down, as are the differential equations. The differential equations were solved with the aid of a computer. In one design the resolution (radius of the circle of confusion) is 0.06 cm at an object distance of 1.5 cm and an aperture angle of  $60^\circ$ ; in the other design all the third order aberrations are less than  $10^{-7}$ , there is a real image, and the magnification is less than 0.01. Orig. art. has: 16 formulas and 2 figures.

TITLE: On an automodel solution of the problem of rotation of a circular cylinder inside a viscous-plastic liquid.  
(Ob odnom avtomodel'nom reshenii zadachi o vrashchenii kruglogo tsilindra v vyazko-plastichnoy zhidkosti).

PERIODICAL: Izvestiya Akademii Nauk SSSR, Otdeleniye Tekhnicheskikh Nauk, 1957, No.11, pp.184-185 (USSR)

ABSTRACT: The problem of the non-steady state circular motion of a viscous-plastic liquid has been dealt with by several authors (Refs.1-3). For the general case of non-steady state movement of a viscous-plastic liquid the boundary problem with mobile boundaries applies. Earlier, one of the authors (Ref.4) applied the method of Slezkin-Targa for solving the problem of non-steady state movement of a viscous-plastic liquid inside a circular tube. In the above mentioned papers accurate solutions were obtained but the problem of mobile boundaries has not been considered. In this paper an automodel solution is given of the particular problem of the rotation of a circular cylinder of a negligibly small radius inside a boundless liquid; the problem, which is of interest in itself, can also be utilised for verifying various approximate methods,

TITLE: On a Self-similar Solution to the Problem of the Spin of a Circular Cylinder in a Plastic Viscous Fluid (Ob odnom avtomodel'nom reshenii zadachi o vrashchenii kruglogo tsilindra v vyazko-plastichnoy zhidkosti)

PERIODICAL: Dok. AN AzerbSSR, 1957, Vol 13, Nr 4, pp 365-368

ABSTRACT: A study is made of the flow of a plastic viscous fluid caused by the spinning within it of an infinitely slender cylinder. The problem reduces to integrating a linear differential equation of the second order, the solution to which consists of the summation of the exponential and the integral exponential function. The integration constants for some values of the problem's parameters are determined by a numerical analysis, the results of which appear in the form of a graph. Equations (2) and (10) contain typographical errors.

AUTHOR: Gurbich, A. S.

TITLE: An Experimental Investigation of the Frequency Spectra of the Vertical Component of the Wind Velocity in the Atmospheric Strata Near the Ground ✓

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 4, pp. 806-809

TEXT: The measurements described here were carried out from August to September 1958 in the Tsimlyansk region. About 100 spectra were recorded, and the Richardson number was assumed to be characteristic of the stratification. The measuring instruments for the mean temperature and the mean wind velocity were located in heights of 0.5, 1, 2, 4, 8, and 12 m, and the dynamic velocity was calculated according to the vertical velocity profile. This work was performed under the supervision of A. V. Perepelkina. The frequency spectra for the Richardson number  $-0.09$  with the curves I obtained in a height of 4 m are graphically represented in Fig. 1, and with the curves II the same is the case with the spectra normalized according to formula (1). Thus, the averaged spectra for

Card 1/3

B014/B007

approximately equal Richardson numbers could be determined. The curves III in Fig. 1 for  $Ri = -0.09$  show the averaged frequency spectra in heights of 1 and 4 m. From Fig. 2 it may be seen that the shape of the spectra is analogous for different meteorological conditions and that a monotonic dependence on the Richardson number exists. The calculations of the exponent gave the value 1.64, so that the "2/3 - law" by Kolmogorov-Obukhov is practically confirmed. The energy distribution in the spectrum under consideration is graphically represented in Fig. 3. The energy distribution for three different Richardson numbers is shown, and it may be seen that the main part of energy is in the spectral region under discussion. From the graphical representation of the dependence of the quantity  $\sigma_{\omega}/v_*$  ( $\sigma_{\omega}$  is the dispersion of pulsations,  $v_*$  is the dynamic velocity) on  $Ri$  it may be seen that with increasing instability the  $\sigma_{\omega}/v_*$  ratio increases. This is related with an increase in pulsations of the vertical velocity components at the expense of convection. From the relation between the spectral function and the structural function, the structural constant  $c^2$  is finally derived, and further, the derivative of the structural constant  $c_0^2$  is dealt with in consideration of the

deviation of the profile from the logarithmic dependence. Table 1 gives the constants for various Ri values. The author points out the possibility of constructing a universal spectral function. A. M. Obukhov is mentioned. There are 4 figures, 1 table, and 6 references, 5 of which are Soviet.

"Zhur Obshch Khim" Vol XXII, No 6, pp 990-998

When a glacial acetic acid soln of tetrahydro- $\beta$ -  
thiopyrone dioxides is treated with Br and heated,  
a high yield of mono- and dibromosulfones is ob-  
tained. Upon heating with sodium acetate in acetone,  
218724

USSR/Chemistry - Acetylene Derivatives Jun 52  
(Contd)

HBr is split off, and the dioxides of  $\beta$ -thiopyrone  
and of dihydro-1-thiopyrone are formed with a 70-80%  
yield. Describes the results of the synthesis. The  
capacity of the tetrahydro- $\beta$ -thiopyrone dioxides  
to take part in the diene synthesis depends on the  
position of the substituent in the nucleus. Methyl  
groups in the  $\alpha$ -position to the carbonyl group  
makes diene condensation difficult; the methyl group  
in the  $\beta$ -position to carbonyl makes it impossible  
below 200°.

ABSTRACT: The paper deals briefly with the following topics: Failures of radar equipment on board ships as a significant factor in collisions between ships at sea. The recommendations of the International Conference on Safety at Sea held in London, 1960, concerning the radar training of navigation personnel. Directives for radar training issued by Izba Morska (Marine Chamber) in Gdynia and the Ministerstwo Zeglugi (Ministry of Navigation). The approach taken to radar training by the Panstwowa Szkoła Morska (State School of Marine Navigation) in Gdynia. The training vessel "Horyzont" and its training equipment. The program of training in the use of radar at sea implementing the recommendations of the London Conference. The training voyage of the vessel "Horyzont" to London. Detailed program of radar training course as approved by the Ministry of Navigation, in December 1964. The achievements of the State School of Marine Navigation.

tion are briefly summarized; up to February 1965, the school had organized 11 radar training courses on board the "Horyzont" and had issued 135 diplomas. Future plans for increasing the number of students are mentioned; another training vessel, the "Zenit," will be used by the School in Gdynia and in the next few years two more training vessels will be used in Szczecin. TITLE: A method for obtaining stabilized polyformaldehyde. Class 39, No. 176406

15/44/55

15

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 22, 1965, 59

TOPIC TAGS: polymer, polymerization, polyformaldehyde plastic, nitrogen compound

ABSTRACT: This Author Certificate presents a method for obtaining stabilized polyformaldehyde by introducing into the finished polymer a stabilizing system consisting of a polyamide and nitrogen-containing compound. To increase the thermostability of the polymer, 2,2,6,6-tetramethyl-4-oxypiperidinoxyl, phenylcarbonate-2,2,6,6-tetramethyl-4-ethyl-4-oxypiperidinoxyl is used as the nitrogen-containing compound.

Certain Problems (Cont.)

SOV/5460

COVERAGE: The experience of the LMZ (Leningradskiy metallicheskiy zavod - Leningrad Metalworking Plant) in the manufacture of modern large-capacity turbines is presented. Methods for the rationalization of basic manufacturing processes and for the mechanization and automation of manual operations are given. Descriptions of attachments and tools designed by LMZ for improving labor productivity and product quality are provided, and advanced inspection methods discussed. References accompany some articles. No personalities are mentioned. There are 26 references: 25 Soviet and 1 English.

TITLE: The automation of the cold-working of disk springs

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 7, 1961, 80, abstract 7B629 (V sb. "Nekotoryye vopr. tekhnol. proiz-va turbin", [Tr. Leningr. metallich. z-da, no. 7], Moscow-Leningrad, 1960, 192 - 195)

TEXT: The authors describe an installation, operating on compressed air, for the shaping and cold-working of disk springs made of 1X18H9T (1Kh18N9T) sheet steel. A uniform cold-working is ensured by the simultaneous rotating and reciprocating motion of the head. The spring machining intensity depends on the number of revolutions, number and force of the head strokes. The utilization of the automatic cold-working installation increases the labor productivity and improves the spring quality. These installations are used (with insignificant modifications) for the gluing of wooden planks to metallic bands with the aid of steel rivets with semicircular heads. There are 5 figures. N. Il'ina

TITLE: High-efficiency "corn-type" milling cutter ("kukuruznaya freza")

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 8, 1961, 63, abstract 8B477 (V sb. "Nekotoryye vopr. tekhnol. proiz-va turbin". [Tr. Leningr. metallich. z-da, no. 7], Moscow-Leningrad, 1960, 337 - 339)

TEXT: The authors describe the design of end milling cutters 30, 40 and 60 mm in diameter with relieved teeth ("corn-type" milling cutter), suggested by LMZ workers. In contrast to the milling cutters according to ГОСТ (GOST) 4675-49 (and correspondingly GOST 4675-59), "corn-type" cutters have a smaller number of teeth corresponding to  $Z = 3$ ,  $Z = 4$  and  $Z = 5$ , a larger angle of inclination ( $\omega = 40^\circ$ ) and a larger chip groove volume which makes it possible to use higher cutting conditions during the machining of steam turbine parts. There are 3 figures and 2 tables.

TITLE: A scientific technical conference on the campaign against thermal losses in electric power stations and in industry. (Nauchno-tekhnicheskaya konferentsiya po bor'be s teplovymi poteryami na elektrostantsiyakh i v promyshlennosti).

PERIODICAL: Teploenergetika, 1958, No.6. pp. 92 (USSR)

ABSTRACT: The conference was held from 10 to 13th February, 1958 in Tomsk, and was called by the Tomsk Polytechnical Institute. It generalised the experience of Siberian power engineers in introducing measures to economise fuel and heat in power stations and in industry. Special attention was drawn to the use of secondary sources of heat. Participants in the Conference included representatives of a number of power stations, of the Siberian division of ORGRES, of the Eastern division of the All-Union Thermotechnical Institute, of the Tomsk Polytechnical Institute, of ZSFAN USSR and others. Seventeen reports were read. The Conference noted that with increasing use of cheap fuel, it is important to cheapen the equipment of thermal power stations. In this respect it is useful to instal low-pressure economisers and to superpose high-pressure sets on medium-pressure stations. The Conference noted that there is no formalised way of

evaluating thermal power installations and that the existing staff coefficient, related to kilowatts output without allowing for boiler-house capacity, is incorrect. The training of engineers in the Tomsk Polytechnical Institute was also considered. The Tomsk Institute should take more power engineers and should commence training specialists in water technology and fuel.

TITLE: The Process of Steam Generation during the Outflow of Boiling Water (O protsesse parobrazovaniya pri istechenii kipiyashchey vody)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy - Energetika, 1958, Nr 9, pp 68-72 (USSR)

ABSTRACT: The author's experimental study of the flow of boiling water through cylindrical nozzles of varying lengths has furnished data on the consumption of boiling water and on pressure variations throughout the length of the nozzle which enables us to calculate the water vapor content and the degree of steam formation. The paper contains vaporization factor values in two different forms. A comparison of the two sets of values shows that the vaporization factor calculated from the amount of steam formed during the outflow of boiling water, is much greater than during the actual vaporization process. Such an increase in the intensity of steam

Card 1/3

SOV/142-58-9-11/18

The Process of Steam Generation During the Outflow of Boiling Water

generation can be explained by the fact that the vaporization process occurs not only on the free surface of the fluid, but also on the surface of the vapor bubbles which arise within the liquid and form a vaporization surface. The presence of vapor bubbles within the liquid is a characteristic of the vaporization process. Thus steam generation occurs through boiling and not through surface vaporization. Consequently, the surface vaporization method must be regarded merely as an artificial computational technique when determining the consumption of boiling water, i.e. a technique that does not take into account all steam generation characteristics during flow. There are 3 tables, 1 diagram and 6 references, of which 5 are Soviet and 1 English.

in the steel at 150 c/s are 25 kw, and calculations have  
shown that the magnetic circuit must be artificially  
cooled. Fig 1 shows the final system for air cooling of  
the magnet. The system consists of two independent  
ventilation circuits, one for the upper and one for the  
lower part of the electromagnet. A collecting air duct  
is fitted to the upper and lower yokes and vertical  
ventilators (1) are attached to it. The electric motors  
(2) of the ventilators are supported by special brackets  
independently of their chambers. The latter are sealed  
to the air ducts which collect the air passing through the  
cooling tubes inside the electromagnet. The cooling  
channels (4) are formed by special rectangular slits  
10 x 100 mm in size, as shown in Fig 1. The cooling air

The Cooling System of the Electromagnet of a Double-Beam 25 MeV  
Betatron

enters through the windows (5) on each side of the yoke, is drawn through the channels, and then collected by the air duct, from which it is removed by the ventilators. The amount of air drawn through each system is 7000 m<sup>3</sup>/hr, and the speed in the internal channels shown in Fig 1 is 14-16.5 m/sec. Simple formulae are derived for estimating the amount of heat removed. There are 1 figure, 1 table and 5 Soviet references.

TITLE: Calculation of the Heat Transfer<sup>71</sup> in the Cooling Plates of Air-Cooled Betatron Magnets 21

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Elektromekhanika, 1959, Nr 2, pp 124-127 (USSR)

ABSTRACT: In air-cooled transformers, of which a betatron electro-magnet is an example, the heat loss by the walls of the yoke is limited by the usually low emissivity of the surface when the latter is cooled by blowing air onto it. In order to increase the amount of heat extracted, special copper cooling plates were inserted into the coil of the magnet, as shown diagrammatically in Fig 1. A calculation has been carried out to determine the optimum dimensions of such a cooling plate. It has been found that the cooling effect is a maximum for a certain depth of insertion of the cooling plate into the magnet core (Fig 4). Fig 4 is a plot of the dependence of the cooling effect per unit area of the plate as a function of the depth of insertion. There are 4 figures and 1 Soviet reference.

<sup>B</sup>

SOURCE: AN GruzSSR. Soobshcheniya, v. 39, no. 1, 1965, 188-189

TOPIC TAGS: animal disease, veterinary medicine

ABSTRACT: To clarify the part played by Alveococcus multilocularis in the etiology of alveococcus in farm animals, experiments were performed to test the sensitivity of young pigs, lambs, and calves to alveococcosis. The experimental results show an absence of alveococcal sensitivity in young pigs and calves, and the sensitivity was lowered in lambs (i.e., atypical vacuoles developed with no embryonic forms of scolex). The data obtained confirm the observations that farm animals do not participate in the biological cycle of A. multilocularis which causes alveococcosis.

TITLE: Ground state of the  $Ge^{2+}$  ion

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 5, 1961, 7, abstract 5556 (5B56) ("Sakartvelos politeknikuri instituti. Shromebi, Tr. Gruz. politekhn. in-t", 1958 (1959), no. 1 (62) 157-167)

TEXT: The ground state  $1s^2 2s^2 2p^6 3s^2 3p^6 3d^{10} 4s^2$  of  $Ge^{2+}$  was studied by the self-consistent field method by Hartree-Fock in Slater approximation (averaged exchange energy of the electron interaction). The Hartree-Fock equation is solved by the method of successive approximations. The initial functions were obtained from the Hartree functions. The maximum deviations from the experimental energy values amount to 8 % for the optical term and to about 15 % for the roentgen term (for the 3p-level). The maximum deviation from the Hartree results are approximately 19 %. The deviations of the radial wave functions range from 1 to 11 %. The extreme values are somewhat shifted toward the nucleus (compared with the Hartree

TOPIC TAGS: atomic theory, field approximation, quantum mechanics, germanium atom, Hartree Fock method, density matrix, spin coordinate, spherical harmonic, exchange potential, Slater potential, energy level, diamagnetic susceptibility

ABSTRACT: A two-particle density matrix,  $P_2(1, 2, 1', 2')$ , originally formulated by R. Meehan (Rev. Mod. Phys. 32, 335, 1960), is integrated with respect to spin coordinates and expressed in terms of single electron functions of a central field (spherical harmonics). Integration with respect to angles results in an expression averaged with respect to direction of the correlation terms. This can be regarded as the radial exchange density from which the exchange potential is derived. Using this expression, the full potential has a correct asymptotic behavior ( $\lim_{r \rightarrow \infty} W(r) = 2$ ) as compared with Slater's potential  $W(\infty) = 0$ . Results of computer solutions of the single-electron equation for the Ge atom are given in the form of curves of  $P_{1s}, P_{2p}, P_{2s}, P_{3s}, P_{3d}, P_{3p}, P_{4p}$  and  $P_{4s}$  versus  $r$ . TITLE: Scattering of slow electrons by atoms

SOURCE: AN LitSSR. Litovskiy fizicheskiy sbornik, v. 3, no. 1-2, 1963, 199-201

TOPIC TAGS: electron scattering, slow electron, slow electron scattering, electron atom interaction, Hartree Fock method, exchange operator, electron momentum, helium atom

ABSTRACT: The self-consistent field method due to Hartree and Fock gives the most accurate approximation of the interaction between an electron and an atom. Simplification of the method by omitting exchange terms results in inaccurate answers at low energy levels. A classical analog for the exchange operator  $A$ , given by Fock (ZhETF, 4,5,1934), is shown to differ only by a constant from the exchange operator derived by Slater (Phys. Rev., 81, 385, 1951) for electrons in an atom. Representing the electron states by plane waves, an analogous exchange operator for the colliding electron is derived. This operator reduces to Slater form when the momentum of the colliding electron is much greater than the momentum of the atom electrons. When the opposite is true, scattering of slow electrons takes place. When the changes in the wave functions of the atom electrons caused by the colliding slow

Card

1/2

ACCESSION NR: AT4041513

electron are neglected and only s-scattering is accounted for, a variational procedure is used to obtain the solution for the scattering length  $a$ . Applied to a helium atom, the method gives  $a = 2.3$  as compared to the true value of  $-1.52$ . The elastic cross section of the electron-atom collision computed using this method give values which deviate from the true values by a factor of about 2.3. "The author expresses his deep gratitude to G. F. Drukarev for valuable discussions." Orig. art. has: 11 equations and 1 table.
