Osnovnyye voprosy planirovaniya yedinoy energeticheskoy sistemy SSSR (Basic
Problems in Planning a Unified Power System for the USSR.) Moscow,
Izd-vo AN SSSR, 1959. 174 p. Errata slip inserted. 2,500 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Energeticheskiy institut.

Eds.: G.M. Krzhizhanovskiy, Academician and V.I. Veyts, Corresponding
Member, USSR Academy of Sciences; Tech. Ed.: S.G. Markovich.

PURPOSE: This book is intended for government planning circles, scientific
research organizations and others interested in the electrification of the
USSR.

COVERAGE: The book examines the principal problems of a unified power system

Basic Problems (Cont.)

SOV/2382

for the USSR as a basis for a program of government planning in that field. It is the result of several years of study conducted mainly at the Power Engineering Institute of the Academy of Sciences, USSR, in cooperation with power engineering institutes of the individual Soviet Republics, universities and learned societies, and in close cooperation with the Gosplan, USSR. These studies are concerned with basic problems of a scientific nature and problems of technical policy for the prospective development of a unified electric power system in the USSR. The problems outlined are applicable when the planned system reaches an output of 1000 billion kwhr's which is scheduled for 1970. One of the results of the plan is, that since it is possible to obtain higher installed capacities in a shorter time and at lower capital outlays by the construction of steam-turbine electric power plants rather than hydraulic ones, the emphasis is now on building steam-turbine plants with a simultaneous slowdown in hydro-power developments, excepting the most economical ones or those which are the only or the main sources of power in a given region or are dictated by other needs, such as irrigation, river control, etc. Nuclear plants will play a steadily increasing role in the development of a unified power system. Several problems of a purely scientific and technical nature were prompted by the study of a unified system: problems of nuclear power stations, the application of high-speed electronic computers for automatic control, regulation and protection

Card 2/11

Basic Problems (Cont.)

SPV/2382

of the system, the increasing use of semiconductors, the use of various types of fuels, etc. These problems were presented in two earlier publications of the Academy of Sciences: Nauchnyye osnovy sozdaniya i razvitiya yedinoy energeticheskoy sistemy SSSR (Scientific Bases in the Creation and Development of a Unified Power System in the USSR; Conclusions of a Coordinating Conference, Moscow, 1957); and Razrabotka nauchnykh osnov razvitiya energeticheskikh sistem i ikh ob"yedineniya yediniyu energeticheskuyu sistemy (Working Out of Scientific Bases in the Development of Power Systems and Their Integration Into a Unified Power System. Series: Voprosy sovetskoy nauki, Moscow, 1958). The following persons participated in writing the book: F.D. Avramenko (Chapters 2 and 4); V.I. Veys (Chapters 2, section 4 of Chapter 3, Chapter 4, section 1 of Chapter 6, Chapters 8 and 9); B.A. Gurevich (Chapter 1, section 1 of Chapter 7); V.I. Denisov (Chapters 4 and 8); A.G. Zakharin (section 2 of Chapter 7); N.A. Kareulov, S.N. Kritskiy and M.F. Menkel' (Chapter 5); N.N. Krachkovskiy (section 4 and 5 of Chapter 6); I.S. Koslov (section 8 of Chapter 1); M.M. Lebedev (Chapter 6, section 1 of Chapter 7, Chapters 9,10,11); T.K. Leont'yeva (section 1 of Chapter 3); A.S. Nekrasov (sections 2 and 3 of Chapter 9); G.I. Rossiyevskiy (Chapter 3); B.I. Shvorin (Chapter 2). Those who participated in preparing the material were: M.M. Albegov, K.N. Bestuzheva, V.A. Bondareva, M.S. Vdovchenko, A.L. Velikanov, Ye.A. Volkova, V.A. Gadiyeva, I.T. Kon'ya, D.N. Korobova, Yu.S. Kretinina, M.A.

Lebedev, Candidate of Mechanical Sciences, and I.E. Rabinow.	
PREFACE: This collection of articles is intended as a tribute to the memory of Academician G.M. Frishchtein.	
CONTENTS: The collection contains thirty articles by former students and contributors of the academic department. The articles deal with problems of a wide range of subjects in the field of power engineering: problems of the technical development of electrical and thermal power engineering, power engineering technology, and the physics of combustion. No personalities are mentioned. References are given after most articles.

TITLE: On the 70th Birthday of N. N. Krachkovskiy

PERIODICAL: Elektricheskoe, 1960, Nr 4, p 93 (USSR)

TEXT: Nikolay Nikolayevich Krachkovskiy is one of the oldest Soviet power engineers. He started his activities in 1916 after finishing his studies at the elektromekhanicheskogo otdeleniya Petrogradskogo politekhnicheskogo instituta (Department of Electromechanics of the Petrograd Polytechnic Institute). From 1922 he worked at the planning and construction of electric networks in the Volkhovstroy, Dneprstroy, and Sredvolgastroy. He worked as an engineer in a leading position in the eastern regions of the USSR from 1942 to 1944. From 1944 to 1946 he was Director of the sektsion sistema Leningradskogo otdeleniya Gidroenergoproektika (Sector of Networks of the Leningrad Branch of the All-Union Trust for the Design and Planning of Hydroelectric Power Plants and Hydroelectric Developments). His scientific and teaching activity began in 1950 at the Politekhnicheskii Putey soobshcheniya (Polytechnic Institute of Railroads), at the Leningradskiy politekhnicheskiy institut (Leningrad Polytechnic

Card 1/2

Institute), and the Akademiya nauk SSSR (Academy of Sciences of the USSR). Since 1950 he was in a leading position at a Planning Institute, directing simultaneously research work at the Energeticheskii institut AN SSSR (Institute of Power Engineering of the AS USSR). Since 1954 he has devoted himself entirely to scientific work. He graduated as a Candidate in 1948. In 1955 he was approved as a Senior Scientific Collaborator of the Institute of Power Engineering of the AS USSR in the field of "Electric Networks". He published over 50 papers in the periodicals "Elektricheskoe", "Elektricheskii stantsii", "Izvestiya AN SSSR", et al., and made a number of inventions. There is 1 figure.

AUTHOR: Gurevich, B. D., Engineer
TITLE: Influence of low temperature annealing on the plasticity of permalloys
PERIODICAL: Metallovedeniye i termicheskaya obrabotka metallov, 1961, No.8, pp.51-53
TEXT: The subject of the paper is the manufacture and heat treatment of electromagnetic screens, for which high nickel unalloyed permalloy (78.5% Ni, 0.30-0.8% Mn) and low nickel permalloy (40-50% Ni, 0.3-0.8% Mn) are being used. High nickel unalloyed permalloy has a low electric resistance and a high magnetic permeability, whilst low nickel permalloy has a higher electric resistance. The specimens used were made of cold rolled permalloy strip in the as-delivered state, the mechanical properties of which were as follows: hardness RA = 56-61, elongation 4.7-6.7%, UTS 70-115 kg/mm². Optimum heat treatment: 800 to 900°C in vacuum for one hour. Intermediate annealing at a higher temperature for longer durations

Card 1/3

Influence of low temperature ...

26580
S/129/61/000/008/013/015
E073/E535

was inadvisable due to economic reasons. The plastic properties were adequate for further forming operations. The final heat treatment of the permalloy screens is usually at 1000 to 1200°C with a holding time in vacuum of 8 to 12 hours. However, an attempt was made to find a more economical heat treatment. To re-establish the permeability, it was found necessary to heat the screens to at least 1100°C. The quality of the screens was satisfactory after a cooling speed of 150°C/hour and a holding time of 30 min; a holding time of 40 min gave excellent results. This cooling speed was applied down to 650°C and, following that, cooling was in the furnace, from which they were discharged at 150 to 200°C. Increased cooling speeds did not improve the results. The following conclusions are arrived at: With increasing temperature of the vacuum anneal (for 1 hour) the elongation increases intensively with the annealing temperature up to 800°C. On increasing the temperature to 1100°C no increase in the relative elongation was observed even if the annealing time was increased to three hours. The hardness of the specimens

Card 2/3

Influence of low temperature ...

26580
S/129/61/000/008/013/015
E073/E535

decreases with increasing temperature and soaking time at 1100°C and this decrease is by a factor of about 2 in comparison with the hardness of specimens in the as-delivered state. Compared to vacuum annealing, open air annealing at the same temperature, duration and cooling speed yields lower elongation values. There are 1 table and 1 German reference.

TITLE: Duration of the strengthening effect of surface hardening under static overloads

SOURCE: Vestnik mashinostroyeniya, no. 3, 1964, 21-26

TOPIC TAGS: fatigue strength, surface hardening, cold rolling, static overload; steel 30KhGSA

ABSTRACT: The effects of static overloads on the fatigue strength of surface hardened samples were investigated experimentally using tubes 450 mm long, 30 mm diameter, and 8 mm thick, made of 30KhGSA steel heat-treated to HRC 32-34, 38-46 and 46-52. After obtaining fatigue curves for these hardnesses, similar samples were cold-rolled in a hydraulic three-roll device with a roll profile radius of 5 mm with a rolling force of 1000 kg (for HRC 38-52) and 800 kg (HRC 32-34). It was found that for static preloading in the same direction as the cyclic loads, static overloads did not affect the fatigue strength of the low-hardness steels. For the harder steels a static load of σ_{el} (elastic limit) prior to fatigue tests

Card 1/2

ACCESSION NR: AP4026244

increased the fatigue strength, while a preload of $\approx 1.4 \sigma_{el}$ decreased the fatigue strength by $\approx 29\%$ (based on 10^6 cycles). Static preloads in the opposite direction to the fatigue loading always decreased the fatigue strength. At a preload of $0.9 \sigma_{el}$ the fatigue strength of cold-rolled samples was even lower than the fatigue strength of untreated samples. Orig. art. has: 6 figures and 2 tables.

TITLE: Study of the strength characteristics of some glass-fiber compositions

SOURCE: Plasticheskiye massy*, no. 5, 40-46

TOPIC TAGS: strength characteristics, glass-fiber compositions

ABSTRACT: Lack of adequate detailed data motivated these studies on the tensile, bending, and shear strengths of a number of glass-fiber compositions (AG-4S, R-25S, R-493, 33-18S, KAST-V) with various thermosetting binders. In all cases, the ratio of binder to glass fiber (5-7 micra in diameter) was 30:70, and both flat and cylindrical samples of the molding compounds were tested at various temperatures. The modulus of elasticity (E), Poisson coefficient, maximum tensile strength (Σ sub B), and relative elongation at break (ϵ sub B) were determined for each formulation, as was the correlation between Σ sub B and E sub 0 (E sub 0 calculated at same stress, Σ sub 0 = 4 kg/sec/mm², for all materials) and the effect of thermal treatment. At higher temperatures (up to 250°C), the nonlinearity of the correlation of Σ and E with ϵ was more pronounced than at 150-170°C. The maximum strength of R-493 was almost doubled by treatment at 150-170°C, the modulus of elasticity increased by about 12%, but thermal treatment has little effect on

Card 1/2

L 12968-63

ACCESSION NR: AP3000401

the strength of the other formulations tested. All of the materials had very low Poisson coefficients (0.04-0.15). Susceptibility to concentrated pressure under short- and long-term static stress was tested on unnotched and notched flat samples: in both cases, strength decreased with an increase in cross-section area. At increased temperatures, the influence of scale effect and pressure concentration was reduced. The strongest of the materials tested was 33-18S (epoxy resin base modified with polyurethane): at all concentrations of pressure, it showed a relatively slight increase in susceptibility to stress with time, averaging 50-60% of its maximum short-term strength after 10,000 hours at 20C. Electrical measurements of nonelectrical quantities. Devices for automatic control and regulation in industry). Novosibirsk, Redizdat Sib. otd. AN SSSR, 1964, 84-85

TOPIC TAGS: digital correlometer, linearly correlated random process, correlation function

ABSTRACT: Existing correlation meters determine the correlation function by means of the equation

$$\mu(\tau) = \frac{1}{n} \sum x_i y_i. \quad (1)$$

Card 1/2

L 60447-65

ACCESSION NR: AT5017386

where x_i and y_i are the values of the random functions $X(t)$ and $Y(t)$ within the cross section separated by time intervals τ . The authors of the present paper derive the expression for two admittedly linearly correlated random processes:

$$\mu(\tau) = \frac{x_1}{n x_i} \sum y_{i+1} \quad (2)$$

which shows that for the determination of one point of the correlation function of a linearly correlated random process it is sufficient to carry out n additions and to multiply the resulting sum by a constant factor. The automatic device realizing Equation (2) is significantly simpler than the one operating according to (1), and the block diagram of such a digital correlometer is given. The proposed method may be extended to random quantities whose relation is of the $y_i = ax_i^p$ type. Orig. art. has: 4 formulas and 1 figure.

Variability of Circuits

258 VOLTAGE FLUCTUATIONS IN SEMICONDUCTORS
B. I. Davydov & D.Kh. Gurevich (Journ. of
Tech. Phys. [in Russ.], No. 1, Vol. 12, 1962
pp. 31-35)

It is pointed out that the mechanism of voltage fluctuations in semiconductors is similar to the shot effect in valves, the difference being that electrons are liberated by thermal movement not only on a cathode, but along the whole length of the semiconductor, and that these electrons travel only short distances. A mathematical discussion of the phenomenon is presented. It is shown that when no current passes through the semiconductor the mean square of the fluctuations can be determined from the well-known formula (1) for the Johnson effect. When a small current passes through the semiconductor this value rises in proportion to the square of the current for small currents and in proportion to the current for larger currents. These conclusions are broadly in accordance with experimental results. It was assumed in the discussion that Ohm's law remains valid for the phenomena under consideration.

TITLE: Cybernetics and Some Problems of the Modern Physiology of the Nervous System (Kibernetika i nekotoryye voprosy sovremennoy fiziologii nervnoy sistemy).

PERIODICAL: Vestnik AN SSSR, 1957, Vol. 27, Nr 9, pp. 31-40 (USSR).

ABSTRACT: Since the publication of Norbert Wiener's paper "Cybernetics or Control and Communication in Animal and Machine" the interest for this field of science continuously grows. The author of this paper at first deals with Pavlov's theory of the conditioned reflexes, where he makes the attempt to bring some problems of the physiology of nerves in connection with the fundamental principles of cybernetics. The cybernetics teaches that the fundamental principle of automatic regulation consists in the fact that the motion and the function of larger masses or the transmission of large quantities of energy takes place by information-carriers or transmitters of commands. Then the author deals with the papers by soviet scientists, such as Samoylov, A. F., Bernshteyn and others on the universal distribution of ring-shaped excitation-rhythms in the organism, and on the coordinate activity of motion of living organisms whose suitable character of orientation is

Card 1/2

hardly imaginable without the presence of opposite connections. The information-theory is a strictly mathematical discipline (the papers by Khinchin, A. Ya., Kolmogorov, A. N. and others are described; see figures 2 and 3). Finally the author states that it has to be expected that further contact of the cybernetics with the physiology of the nervous system may lead to new data.

AUTHOR: Gurevich, B. Kh., 20-4-56/60

TITLE: On the Fixing of the Eye with the Aid of Muscle Sense and on the Possible Role of Proprioception on the Occasion of Visual Fixation (Ob ustanovke glaz na osnove myshechnogo chuvatva i o vos-mozhnnoy roli proprieptseptsii v zritel'noy fiksatsii)

PERIODICAL: Doklady Akad. nauk, SSSR, 1957, Vol. 115, Nr 4, pp. 829-832, (USSR)

ABSTRACT: The problem of proprioception of the exterior eye muscle is of principal importance in the general theory of sight. A number of scientists of the last decades affirmed that doubtlessly the muscle sense takes part in the acts of seeing. Also the neurology of the eye moving devices is interested in the solution of this problem. At present the proprioceptors of these muscles are known and their real importance for the visual perception is recognized. Presently in some publications, however, the role of proprioception is either denied on the basis of physiological arguments or even not considered at all. It seems that the turning of the eye in a certain angle without optic stimuli as well as the fixation and the keeping of the optic axes in the direction concerned serve as criterium for the participation of the muscle sense on the occasion of the optic fixation under the same conditions. The experiments were carried out in the dark with an objective recording of the conjugated eye movements by means of electrooculography. At the beginning of the experiment the persons experimented upon turned their

Card 1/3

20-4-56/60

On the Fixing of the Eye with the Aid of Muscle Sense and on the Possible Role of Proprioception on the Occasion of Visual Fixation.

eye in a certain angle when the binocular fixed luminous points changed. A 400 Hz sound signals the appearance of a side point located by a certain angle on the right of the central point, to which the person experimented upon is to direct his eyes. After 2-3 seconds the side point disappeared and the person again fixed the central point. On the occasion of the experiment proper the side point was not illuminated a fact which the person did not know. Inspite of it he turned his eyes to the right and, after having found no luminous point, he was according to the instruction to fix his eyes for 2-3 seconds in the direction where according to his opinion the side point was located. He then switched on the side point himself, fixed it, switched it off and directed his eyes to the central point. It is obvious that in the case of an unprecision of the fixing of the eye at the time of the switching on of the side point the eyes had to perform a corresponding additional turn; in the case of an exact fixing of the eyes (Fig. 1b-g) this turn would be superfluous. Moreover, the action of the precise fixing of the eye muscles is described. In a total of more than 1500 eye fixings of 15 persons at turns of 6,5, 12, 20, 25, 35, and 40° to the right the precise muscle fixings of the eyes (i.e. with an error above the limit measuring accuracy $\pm 30'$) took

Card 2/3

On the Fixing of the Eye with the Aid of Muscle Sense and on the
Possible Role of Proprioception on the Occasion of Visual Fixation.

place more often than fixings with greater errors. The fixings were approximately symmetrically distributed as to the wanted direction. The author could draw the conclusion that the muscle sense doubtlessly takes part in the optic fixation. Moreover, the possible role of the proprioception in the mechanism of the optic fixation is presumably discussed. It might be possible that a repeated chronological coincidence of optic and proprioceptive stimuli is accompanied every time by a reflectoral correction of the situation of the axes and that it leads to the formation of temporary combinations between the proprioceptive and the eye moving (oculomotoric) centers. Certain shifts in the frequency of the proprioceptive impulses gain the importance of a conditioned stimulus for the compensatory eye movements. There are 3 figures and 3 Slavic references.

TITLE: Deep-seated structure of the Ukraine, based on data from geophysical investigations

SOURCE: International Geological Congress. 22d, New Delhi, 1964. Geologicheskiye rezul'taty prikladnoy geofiziki (Geological results of applied geophysics); doklady sovetskih geologov, problema 2. Moscow, Izd-vo Nedra, 1965, 56-69

TOPIC TAGS: tectonics , upper mantle, earth crust, stratigraphy / Ukraine

ABSTRACT: Geological and particularly geophysical investigations have located a great number of deep-seated faults in the Ukraine. These faults have mainly northeast and northwest strikes. The northeast-strike faults predominate in the Ukrainian shield, the Black Sea depression, and the northern part of the Black Sea basin, while northwest-strike faults are typical of the Dneprovsko-Donetskaya depression, the Trans-Carpathian depression, the folded Carpathians, the Carpathian foredeep and the southwestern part of the Russian platform. For the area, as a whole, it has been found that the macrostructural features of deep-seated faults have longitudinal or transverse strikes. Tectonic movements in the Earth's crust

Card 1/2

ACC NR: AT6028370

are mainly caused by compression and expansion of the mantle associated with polymorphic, phase and electron transformations, or chemical alterations. Deep-seated faults originate in the upper mantle hundreds or at least tens of km deep. The main types of faults located in the Ukraine are: 1) ancient Proterozoic faults in the Precambrian basement; 2) faults of different ages, expressed in the basement as major stages and separating principal structural features or their components; and 3) transverse (sometimes longitudinal) faults cutting across the main structures and separating them into individual blocks. In addition, there are many faults in the sedimentary strata which are directly or indirectly associated with the block movement of the basement. The study of the deep-seated crustal structure of the main geotectonic features of the Ukraine is based upon geophysical, mostly seismic, investigations. The block-type structure of the crust has been established, and a number of deep-seated faults have been located. A general feature is increased crustal thickness under uplifts and decreased thickness under depressions. It has been found that the granite layer contains shallow gently sloping seismic discontinuities, which may either separate different structural stages and rock complexes or represent purely physical boundaries. The Ukraine has been divided into structural zones on the basis of geological and geophysical data, and detailed characteristics of all zones are given. Orig. art. has: 2 figures.

TITLE: A device for automatically analyzing seismograms and constructing seismic profiles. Class 42, No. 182349

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 11, 1966, 79

TOPIC TAGS: seismography, cathode ray tube, seismic modeling

ABSTRACT: This Author's Certificate introduces: 1. A device for automatically analyzing seismograms and constructing seismic profiles. The unit is based on Author's Certificate No. 166503. Efficiency of analysis is improved by mounting a cathode ray tube on a carriage which is moved along a photodrum by a worm gear or ratchet turned by the shaft of the photodrum. 2. A modification of this device in which measurement quality is improved by connecting a sawtooth generator through a programmed amplitude regulator to the vertical deflection system of the cathode ray tube.

TITLE: On the Stratigraphic Appurtenance of the Basic Reflection Horizon in the North-East of Crimea and Around the Sivash Lake (O stratigraficheskoy prinadlezhnosti opornogo otrazhayushchego gorizonta na severo-vostoke Kryma i v Prisivash'ye)

PERIODICAL: Dopovidi Akademii nauk Ukrains'koi RSR, 1959, Nr 1,
pp 76-80 (USSR)

ABSTRACT: The article presents the results of seismo-explorations by the reflected-wave method, being done since 1949 in the North-East Crimea and around Lake Sivash (by Vasil'yev, V.P., Gozak, Ch.I., Goncharova, T.A., D'yachkov, N.P., Yegorkin, A.V., Klimarev, A.A., Lantsov, V.P., Poyezdnik, N.D., Rozumenko, G.F., Storozhenko, B.G., Usachov, A.G., and others). Base reflection was discovered in nearly the entire territory. Up to now, the reflecting horizon was wrongly identified as the roof of cretaceous deposits. It is now proved that it

belongs to the **Kumskaya** upper eocene marl pack, which has characteristic physical features, and partly to the underlying middle eocene deposits. The exploration results have to be revised. The eocene deposits of Crimea, around Lake Sivash, and in the North-West Caucasus foothills being similar, the study of the geological interconnection of these regions is now possible. There are 1 map, 1 diagram, and 7 Soviet references.

TITLE: On the Geological Interpretation of Certain Gravitational Anomalies of the Steppe Crimea

PERIODICAL: Dopovidi Akademii Nauk Ukrains'koi RSR, 1959, Nr 6,
pp 643 - 647 (USSR)

ABSTRACT: This is a report of the author on his furthering of the studies made by I. B. Birkhan in 1947 - 50 and by O. A. Belonin and N. M. Karpins'ka in 1957 - 58. The author applied the method described by A. P. Tikhonov and Yu. D. Bulanzhe [Ref 1], subsequently simplified by S. I. Subbotin [Ref. 2]. The author states that the division of the gravitational field of the Steppe Crimea makes it possible to study the local gravitational anomalies and classify them according to the depth of the occurrences of the Paleozoic foundation and the sign, in three groups, which the author defines in the text. The study of the physical properties indicates the absence of a single stratigraphically-stable boundary. In most cases it is the Paleozoic cover, in some

Card 1/2

the Steppe Crimea

cases the Paleocene-Eocene deposits. The Novo-Tsaritsyn gravitational anomaly had different interpretations: G. O. Lichagin and A. V. Chekunov [Ref. 4] consider the anomaly as a reflection of a break in the depth which resulted during the access of heavy magmatic masses. The author subscribes to the opinion expressed by G. Kh. Dikensteyn [Ref. 5], which assumes the presence of a culmination from below. In order to verify and further study this matter, the author has analyzed and reinterpreted the whole data of electric explorations collected on this matter in 1950 by Yu. F. Matusevich and N. S. Muzovska and assisted by Ye. I. Olends'ka, established the existence of a culmination. There are 1 table, 1 map showing local gravitational anomalies and 5 Soviet references.
