TITLE: Fluorometric determination of rhodium in ores by means of rhodamine 6zh

SOURCE: Zavodskaya laboratoriya, v. 29, no. <sup>27</sup>1, 1963, 787-789

TOPIC TAGS: rhodium, rhodamine, fluorometric determination, fusion, MgO, Re

ABSTRACT: A weighed sample of the ore is mixed in a porcelain crucible with 3 gm MgO and 0.1 gm potassium permanganate, then heated in a furnace to 650-700C and held there for 2 hours. The cooled, fused mass is extracted with water, transferred into a flask containing 10 ml of 10-normal sulfuric acid, then diluted with water to the 100-ml mark. A 25-ml portion is transferred to a separatory funnel, to which 1 ml of a 0.1% rhodamine solution is added. After mixing and adding 6 ml of benzene the mixture is shaken, allowed to separate, and the fluorescence of the benzene layer determined (the maximum being located in the 555-560 m $\mu$  region). It was found that mercury caused the most interference, although its fluorescence was 100 times weaker. Chromates, permanganates, and tungstates weaken the fluorescence of rhodium, and for this reason their admixture

Card 1/2

L 15007-63

ACCESSION NR: AP000028

is allowable only up to 100 micrograms for the first two and up to 200 micrograms for the tungstates. Antimony and uranium (when present in quantities of 5-10 mg) raise the fluorescence of 5 micrograms rhenium by 30-40%. The submitted method allows the determination in ores of from 1 to 30 Micrograms of rhenium. Orig. art. has: 3 figures and 2 tables.

The Second All-Union Conference on the Preparation and Analysis of High-Purity Elements, held on 24-28 December 1963 at Gorky State University im. N. I. Lobachevskiy, was sponsored by the Institute of Chemistry of the Gorky State University, the Physicochemical and Technological Department for Inorganic Materials of the Academy of Sciences USSR, and the Gorky Section of the All-Union Chemical Society im. D. I. Mendeleev. The opening address was made by Academician N. M. Zhavoronkov. Some 90 papers were presented, among them the following:

V. P. Gladyshev, L. A. Gudovskaya, A. I. Ivankova, and D. P. Synkova. Fluorimetric and oscillographic polarography methods for determining Te and Se, respectively, in high-purity bismuth, with sensitivity of  $10^{-5}$  to  $10^{-6}\%$ .

AUTHOR: Ivankova, L. I.

TITLE: Analysis of accuracy of the contoured part of topographic plans

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 3, 1962, 16,  
abstract 3G130 ("Inform. sb. Vses. gos. proyektn. in-t Gidroenergo-  
proyekt", 1961, no. 20, 46-48)

TEXT: The author reports on the results of an experimental work of the Leningrad branch of Gidroproyekt in 1955 in magnification of aerial photographs by 5-8 times, where the accuracy of 1 : 2,000 photoplans constructed from aerial photographs on the 1 : 10,000 scale almost did not differ from that from 1 : 3,000 aerial photographs. She presents the scheme of operations for 1 : 2,000 combined surveys from materials of 1 : 10,000 - 1 : 14,000 aerial photosurveys and analyzes the results of the 1958 control. It is stated that the accuracy of the plans obtained meets the requirements of the instruction for the 1 : 5,000 survey. ✓

"Lamelin in the Treatment of Arterial Hypertension."

Belgrade, Medicinski Glasnik, Vol 16, No 9, Sept 1962; pp 410-412.

Abstract [English summary modified] Authors treated with guanethidine 30 hospitalized and 38 outpatients, most of them having either essential (33) or atherosclerotic (19) form of hypertension. Average duration of treatment was 2 to 3 weeks; dose 30 to 50 milligrams per day. Only side effects were mild diarrheal syndrome in 2; good results on hypertension in all patients. Comprehensive discussion of literature on the drug. Structural formulae, 2 tables, many Western authors cited in text but no bibliographic references.

Belgrade, Srpski Arhiv za Celokupno Lekarstvo, Vol 90, No 12, December 1962, pp 1235-1239.

Abstract: [Authors' German summary] Two cases of multiple, benign, family exostoses in a brother and sister are described. Similar exostoses of varying location, size, and appearance were found to exist in three generations on the father's side. Both children had the same blood group and Rh-factor as the father. The deformations were visible in early childhood and had become noticeable by pre-puberty.

Photographs, references to six European and Yugoslav works of recent date.

TITLE: Molecular mechanisms underlying <sup>19</sup>radiation-induced cytogenetic injuries

SOURCE: AMN SSSR. Vestnik, no. 9, 1965, 18-22

TOPIC TAGS: free radical, radiation injury, ionizing radiation, UV radiation, DNA

ABSTRACT: The nature of the injuries produced by different forms of free radicals and by radiation at the cellular and molecular levels is investigated and the local injuries to DNA and DNP are described. The damage to the basic matrix structure of the cell nucleus following ionizing radiation is secondary to the cell's direct absorption of radiant energy. This damage cannot be duplicated by the action of free radicals or ultraviolet radiation. There is a difference between the primary physicochemical changes in DNA and DNP arising from ionizing radiation, free radicals,

TITLE: Analysis of radiation injury to deoxyribonucleoproteins at the molecular and supramolecular levels

SOURCE: AN SSSR. Izvestiya. Seriya biologicheskaya, no. 2, 1966, 197-210

TOPIC TAGS: radiation injury, protein, DNA, x ray irradiation, hydrogen bonding, molecular structure

ABSTRACT: X-irradiation does not give rise to covalent crosslinks within the DNA macromolecule, i.e., it does not prevent the separation of DNA strands or interfere with its replication. The authors' studies on optic rotation of DNA and DNP and melting curves indicate that irradiation causes latent damage to the system of hydrogen bonds. The formation of single breaks in the polynucleotide skeleton may result in rotation around the remaining single bond at the site of the break. This may produce local change in the configuration of the DNA macromolecule, resulting in steric hindrance between the DNA and corresponding protein molecule.

Irradiation with doses below  $10^3$  rad causes breaks only in a small number of DNA molecules. This does not alter the physicochemical properties of the DNA or DNP as a whole, although it undoubtedly has some biological

Card 1/2

UDC: 577.391

L 31194-66

effect. Thus, there is no reason to believe that the effects of low irradiation doses, as manifested in structural rearrangements of chromosomes, are related to changes in the DNA macromolecules. The results of studies on the physicomachanical properties of supramolecular oriented DNP structures present in a medium with physiological ionic strength indicate that these formations are highly sensitive to radiation. TITLE: New Data on the Lower Cretaceous Deposits in the  
Region of the Kanev Fault (Novyye dannyye o nizhneme-  
lovykh otlozheniyakh rayona Kanevskikh dislokatsiy)

PERIODICAL: Nauk. zap. Kiyivs'k. un-t, 1956, Vol 15, Nr 2,  
pp 59-64.

ABSTRACT: In the opinion of a number of investigators, the  
widespread Cretaceous deposits near the Kanev Fault  
belong to the Cenomanian. According to the author,  
Lower Cretaceous deposits occur in the southern part of  
the region where they are exposed in natural outcrops  
in the Mar'in, Kholodnyy and Melanchin gullies. Dense  
yellowish-green sands with poorly preserved fossils are  
found in the lower part. Gray-green sands with seams  
of dense sands occur above this lower part; the  
thickness of this unit is about 19 m. Lucina

(Phaeoides) downesi Woods, Exogyra arduennensis d'Orb., Pecten gaultinus Woods, Pervinguieria ex. gr. inflata Sow. have been identified from outcrops. These forms are characteristic of the Albian. Their presence in the Cretaceous beds of the Kanev fault zone indicate that the formations are upper Albian and not Cenomanian.
