395 strains of *Salmonella*, *Shigella*, *Escherichia*, *Streptococcus haemolyticus* and
M. pyogenes aureus were examined for the production of phosphatase. In 323 cases
positive results were obtained. In 57 cases the results were not evident. Of all
investigated strains 15 only did not produce phosphatase. It was not possible to
use this method for the differentiation of *Haemophilus pertussis* and some related
bacteria, because phosphatase production was not stated in all the investigated
strains.

TITLE: On the Mineralogical Composition of Materials Through the Vertical Cross Section of a Nickel-smelting Shaft Furnace (K mineralogicheskому sostavu materialov po vysote shakhtnoy pechi niklevoy plavki)

PERIODICAL: Tr. In-ta metallurgii. Ural'skiy fil. AN SSSR, 1958, Nr 2, pp 195-200

ABSTRACT: The changes in the principal mineral components of the sinter cake of Ni oxide ores along the height of a furnace were studied. The sulfiding of the charge materials prior to melting proceeds mainly through the action of the gaseous phase. Intense sulfiding begins in the central zone of the furnace at the 800-900-mm level and at the periphery at the 1600-1800-mm level from the tuyères. Most of the Fe is in the form of magnetite. The principal cementing material in the sinter cake, namely, rhombic pyroxene, is transformed in the shaft of the furnace into clinopyroxene and then into diopside, i.e., monoclinic pyroxene, in the course of the concentration of lime in the liquid phase. The peripheric process is clearly evident in the furnace.

TITLE: On Germanium Disulfide (O disul'fide germaniya)

PERIODICAL: Zhurnal Neorganicheskoy Khimii, 1958, Vol. 3, Nr 4, pp. 1060-1061
(USSR)

ABSTRACT: The synthesis of germanium disulfide by the action of a mixture of hydrogen sulfide and sulfur vapor on finely powdered germanium metal at a temperature of 850°C is described. The chemical analysis showed a composition of Ge = 53,05 % and S = 46, 65 %.

The germanium disulfide crystal has rhombic structure, and hardness of 2 - 2,5 and a specific weight of 2,7 g/cm³. Germanium disulfide does neither dissolve in cold nor in boiling sulfuric acid, hydrochloric acid or nitric acid; it is, however, easily soluble in alkaline solutions, especially alkaline hydrogen peroxide. On heating in the air it turns dark and decomposes separating hydrogen sulfide.

X-ray structural analysis proves the rhombic structure of germanium disulfide. There are 2 figures and 6 references,

UR/0181/65/007/006/1890/1892

AUTHOR: Ostroborodova, V. V.; Iyanova, S. V.

TITLE: Interaction between lithium and nickel in germanium

SOURCE: Fizika tverdogo tela, v. 7, no. 6, 1965, 1890-1892

TOPIC TAGS: germanium, semiconductor carrier, carrier density, temperature dependence

ABSTRACT: The purpose of the investigation was to check whether ion pairing occurs in germanium containing lithium and an acceptor impurity simultaneously, this producing two deep levels situated in both halves of the forbidden band. The impurity chosen was nickel, with levels $E_v + 0.22$ and $E_c - 0.31$ eV. The pairing can result either in the formation of neutral complexes and the vanishing of the charged centers, or else in formation of hole-capturing centers, which would thus shift the upper level of the nickel to the lower half of the forbidden band. A check on this phenomenon was made by measuring the temperature dependence of the hole concentration in the samples with nickel before and after introduction of the lithium. The method of preparing the samples is briefly described. The hole concentration

Card 1/3

L 2507-66

ACCESSION NR: AP5014605

was measured in the interval 300 -- 58K. The results, which are shown in Fig. 1 of the Enclosure, indicate that the effect is greatly dependent on the donor and nickel concentrations. The principal feature of the results is that the hole concentration at which compensation takes place increases in samples with large nickel concentration. This is attributed to at least two effects -- formation of complexes with low ionization and an increase in the number of electrically active nickel. The variation of the slope of the plot of the hole concentration against the reciprocal of the temperature is another feature, and indicates that the different atoms of the two impurities have not one ionization energy, but an entire spectrum of ionization energies. TITLE: Tensile and rupture strength of the six-component titanium alloys AT-3, AT-4,
AT-6 and AT-8

SOURCE: AN SSSR. Institut metallurgii. Titan i yego splavy*, no. 10, 1963.
Issledovaniya titanovykh splavov, 345-356

TOPIC TAGS: titanium alloy, AT-3 titanium alloy, AT-4 titanium alloy, AT-6 titanium
alloy, AT-8 titanium alloy, titanium alloy mechanical property, alloy rupture strength,
complex titanium alloy, titanium alloy property, titanium alloy heat resistance, titanium
aluminum chromium alloy, iron containing alloy, silicon containing alloy, boron containing
alloy

ABSTRACT: This study concerns the mechanical properties and high temperature strength
of titanium alloys AT-3, AT-4, AT-6 and AT-8. Specimens were taken from two different
production lots with varying contents of Al, Cr, Fe, Si and B. They were prepared from
forged rods (14 x 14 mm), and subjected to preliminary tempering at 850, 900 and 950C.
Tensile strength was tested at temperatures ranging from 20 to 700C (see Fig. 1 in the

Card 1/62

ACCESSION NR: AT4007058

Enclosure). In addition, the authors considered the effects of forging procedures on mechanical properties (see Fig. 2 in the Enclosure). Rupture strength was tested at temperatures of 400-600°C and loads of 15-55 kg/mm² (results are tabulated), taking into consideration the effect of varying aluminum contents (see Fig. 3 in the Enclosure). The authors conclude that AT titanium alloys with 3-7.5% Al and a combined Cr-Fe-Si content of 1.5-1.8% exhibit high tensile strength (80-90 kg/mm² for AT-3 at room temperature, 90-105 for AT-4, 105-115 for AT-6 and 115-125 for AT-8). The plastic properties deteriorate as the Al content increases (14-15% elongation and 51-53% cross-section shrinkage for AT-3, 11-13% and 38%, respectively for AT-8). The rupture temperature rises as the Al content increases (450°C for AT-3 to 550°C for AT-8). The high temperature strength was good. The tempering temperature affects the duration of rupture strength tests. In view of their mechanical properties at room and high temperatures and their high temperature strength, the alloys named are suitable for wide use in modern technology. Orig. art. has: 4 tables and 4 graphs.

TITLE: The effect of thermal processing on the mechanical properties of type AT2 alloys

SOURCE: Soveshchaniye po metallokhimii, metallocedeniyu i primeneniyu titana i ego splayov, 6th. Novyye issledovaniya titanovykh splavov (New research on titanium alloys); trudy soveshchaniya. Moscow, Izd-vo Nauka, 1965, 238-242

TOPIC TAGS: titanium, titanium alloy, tempering, thermal treatment / AT2 titanium alloy

ABSTRACT: The results are given for studies of the effect of thermal processing on the mechanical properties of type AT2 alloys. Several compositions were investigated, which displayed high plastic and shock-resistance properties at room and at low (-196 and -253C) temperatures. These alloys were given the designations AT2-1, AT2-2, and AT2-3, and were produced in sheets in industrial conditions. Measurements were made of the dependence of the resistivity of these compositions on the testing temperature (see Fig. 1). Thermal processing was bounded in the temperature range 500--1000C. The thermal process included: 1) heating at the prescribed temperature for 30 minutes; 2) 60-minute air-cooling, and 3) 60-minute oven cooling. The mechanical properties of the

Fig. 1. The dependence of the resistivity on the testing temperature of alloys AT2. 1 - AT2-1; 2 - AT2-2; 3 - AT2-3.

alloys are related to the observed changes in the alloy microstructure occurring with varied thermal processing. Recommendations are: 30- to 60-minute thermal treatment at 500 to 600°C with subsequent air cooling for alloy AT2-1; 600°C processing for alloy AT2-2; and 500--600°C processing for AT2-3. The optimal mechanical properties obtained with the recommended processing are summarised. Orig. art. has: 5 figures.

EXCERPTS AND PREPARED INDEX

Morphogenetic processes and the central nervous system. II. Relations between neural and hormonal regulation of amphibian metamorphosis. Tat'jana Ivanova. *Zhur. Obozr. Biol.* (J. Gen. Biol.) 9, 216-71 (1948). Tests with tadpoles of *Rana temporaria*, *R. chinensis*, and *R. ridibunda* showed that regulation of metamorphosis by the central nervous system is not entirely independent. It is aided by thyroid and pituitary hormones. Thyroid influence operates through the diencephalon, controlling resorption. In this respect proliferation appears to be autonomous. Pituitary hormone is about equal to thyroid hormone in power to accelerate resorption in cerebrectomized tadpoles. Julian F. Smith

Title: Production of Caustic Soda by the Reaction of Sodium Sulfide with Manganese Ores and Industrial Wastes (Manganese Process)

Original Periodical: Tr. Gruz. politekhn. in-ta, 1955, No 5 (40), 30-41 (Georgian summary)

Abstract: The possibility of replacing expensive peroxide ores with low-cost ores and industrial wastes has been investigated. Among the substances which were tested are the following: black "bel'ta," [mud?] red "bel'ta," manganese carbonate ore, anode slime from one of the operating plants, and manganese slime, a waste product of the Chiatur manganese industry. It has been established that manganese carbonate ore has a very low sulfur removing ability. Red bel'ta and black bel'ta show a much greater activity (90 and 92%,

TITLE: On the Problem of the Application of the Spectroscopical
Isotope Method for the Determination of Hydrogen

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1959,
Vol 23, Nr 9, pp 1120 - 1123 (USSR)

ABSTRACT: In the present paper a variant of the spectral isotope apparatus described by A. N. Zaydel' and Petrov (Refs 1-4) is used. This apparatus consists of a diffraction spectrograph of the type DS-1, a photoelectric recording device, and a vacuum system, the principles of which are shown by figure 1, and which generates a pressure of $5 \cdot 10^{-3}$ torr. The corrections to the data obtained by the authors and by A. N. Zaydel' are then dealt with in detail, and the measurement values obtained from ten tests are compared in table 1 for three different pressures. It was found that the correction factor increases with increasing pressure. Table 2 shows the results obtained by the determination of hydrogen in three steel alloys. This method may be employed for the purpose of investigating the hydrogen distribution over the cross section of forged work-

Card 1/2

On the Problem of the Application of the Spectroscopic Isotope Method for the Determination of Hydrogen SOV/48-23-9-31/57

pieces of degased Cr-Ni-Mo-steels. Further, the results obtained by a comparison of the here determined hydrogen values with the plastic properties of the metal are given. The diagrams of figure 3 show the distribution of the hydrogen content depending upon the distance between the investigated part and the surface. An increase of the hydrogen content from the periphery to the center was found. The introduction of this method in work laboratories meets with difficulties because of the necessary equipment with non-standardized devices, and experiments were undertaken with a view of employing this method with a standard equipment. There are 3 figures, 2 tables and 4 Soviet references.

Seismicheskaya nauchnaya (Geologic Prospecting) Moscow, Izdovo Akademiya Nauk SSSR, 1959.
376 p. (Series: Itogi: Trudy, No. 6 /175/.) Printed in black. 1,500 copies.

Ed.: I.M. Berzin, Doctor of Physical and Mathematical Sciences; Ed. of Publishing House: L.I. Matkovskiy Tech. Ed.: V.V. Volkova.

Purpose: This publication is intended for geologists and geophysicists, particularly for those interested in the study of seismic waves and their use in geological prospecting.

Content: This is a collection of 17 articles published by the Academy of Sciences USSR as transactions of the Institute of Physics of the Earth. The first four articles present mainly an analysis of fundamental properties of waves. The second group of four articles deals with problems of frequency analysis of seismic waves. The remaining articles cover a wide field of problems in seismology, such as methods of interpretation of dynamic properties of waves, observation of reflected longitudinal waves, design of high-frequency seismic instruments, etc. References are given at the end of each article. TITLE:

Application of the Seismic Frequency Sounding for
Investigation of the Top Layer

PERIODICAL:

Izvestiya Akademii nauk SSSR, Seriya geofizicheskaya,
1960, Nr 2, pp 223-228 (USSR)

ABSTRACT:

New experimental data obtained from measuring the apparent incidence angles of the waves falling on the Earth's surface are described. The measuring apparatus were set for recording various frequencies. The method used was that described by G.A. Gamburtsev who called it "seismic frequency sounding" (ChSZ). The data were obtained in 1958 by the Dnepr-Bug seismic expedition of the Institute of Physics of the Earth, Academy of Sciences USSR. The area investigated consisted of a stratum of sand-clay 100 m thick lying on top of the granite foundation. The 9 to 12 m top layer had a wave velocity v_{II} 400 to 550 m/sec and the deeper layers 800 to 1000 m/sec. The velocity in the granite was 5800 to 5900 m/sec. The measurements of the apparent incidence angles of various frequencies were performed in two

Card 1/3

E131/E459

Application of the Seismic Frequency Sounding for Investigation of
the Top Layer

different ways: a) the diffracted waves propagating in
the foundation were recorded and b) direct waves
generated by detonation inside shallow wells and ore
massives were recorded by the seismographs placed at the
surface. The interpretation of the results led to the
conclusions illustrated in Fig 1 to 5, which illustrate
the relationship between the upper apparent incidence
angle and the frequency of the recorded vibrations.
Fig 1 shows the relationship of the apparent incidence
angle $90^\circ - \bar{e}$ of the diffracted wave PPP and the
frequency f for two different observation points
(\bar{e} is the apparent angle of the wave emergence). Fig 2
shows the same relationship for the direct wave; Fig 3
same as Fig 1 but for various depths. Fig 4 gives the
relationship between the apparent incidence angle
 $90^\circ - \bar{e}$ of the direct wave and $\lg T$ for various
detonation points (T is the mean wave period). Fig 5
represents a comparison between the experimental and
theoretical curves obtained for the relationship between

Card 2/3

Application of the Seismic Frequency Sounding for Investigation of
the Top Layer

the apparent incidence angle $90^\circ - \bar{\epsilon}$ of the direct wave
and $\lg T$ for the function $\lg \lambda_1/h_1$ calculated for
 $v_2/v_1 = 2.5$ of the two-layered medium. The incidence
angle of the direct wave falling on the surface is
denoted by α in Fig 2 and 5. There are 5 figures and
9 references, 7 of which are Soviet and 2 English.

8/3057/63/000/000/0054/0074

AUTHOR: Gorodinskiy, S. M.; Panfilova, Z. Ya.; Zelenov, A. S.; Baryshev, V. S.; Ivanova, T. G.; Nosova, L. M.

TITLE: The design of protective coverings (shieldings) of formula 57-40 masticated rubber for structural elements

SOURCE: Zashchitnye pokrytiya v atomnoy tekhnike (Shielding in nuclear engineering); sbornik statey. Moscow, Gosatomizdat, 1963, 54-74

TOPIC TAGS: protective shielding, radioactive shielding, masticated rubber, 57-40 rubber, rubber welding, welding RIG, radioactivity, nuclear shielding

ABSTRACT: In this detailed and extensive article, the authors describe the use of formula 57-40 masticated rubber for purposes of radioactive shielding. The article consists of two main parts: Part 1 - the shielding of floors, and Part 2 - the use of the masticated rubber for the facing of walls and stairs. The conditions of applying the rubber, the preparation of the floor surface, the preparation of the masticated rubber for welding, the actual welding of the material with high-frequency current, the use of various rigs for welding (the SPPR and the PS), the making and application by welding of flanges and crimps, high-frequency lap

Cord 1/2

ACCESSION NR: AT4016994

welding of rolls and sheets of masticated rubber, hot air welding of the material and, finally, carpeting are considered. In the section dealing with the lining of walls and stair flights with formula 57-40 masticated rubber, the authors give special attention to the use of the construction-assembly pistol (clamp pistol) for fastening the rubber. Two methods for the lining of walls are described and diagrammed and the entire procedure to be followed in the covering of stairs is outlined. A separate section is devoted to the problem of joining surfaces lined with the masticated rubber to metallic facings and shells. A diagram shows how this operation might best be performed. The article concludes with a discussion of the most frequently encountered welding faults (for both the high-frequency and the hot-air techniques) and how they may be eliminated, and with some remarks on weld quality control and safety regulations to be observed in work of this type. Orig. art. has 14 figures.

TITLE: Glue PED-B for gluing formula 57-40 masticated rubber to the surfaces of building structures

SOURCE: Zashchitnye pokrytiya v atomnoj tekhnike (Shielding in nuclear engineering); sbornik statej. Moscow, Gosatomizdat, 1963, 80-92

TOPIC TAGS: glue PED-B, 57-40 masticated rubber, masticated rubber, radioactive contamination, radioactive shielding, nuclear shielding, glue

ABSTRACT: The authors discuss the shortcomings of certain of the glues thus far used for fastening the polyvinylchloride masticated rubber shielding (formula 57-40) which is presently in wide use as a protection against radioactive contamination. Experimental work has shown that glue compositions on a perchlorvinyl resin base with a small admixture of epoxide resin ED-5 have good adhesion to formula 57-40 polyvinylchloride masticated rubbers. The introduction into the composition of epoxide resin hardeners leads to the formation of a three-dimensional structure during the hardening process of

Card 1/3

ACCESSION NR: AT4016996

the glue, resulting in a considerable increase in the strength of the bond in comparison with perchlorvinyl glues. The authors enumerate the most important general requirements of a glue for these purposes: necessary strength and service life of the glue bond, viability of the glue and non-inflammability during the working process, and others. The special requirements were the following: 1) The glue must not impair the desorption properties of the shielding with respect to radioactive contamination; 2) The surface of glued lap bonds of glued materials must not accumulate radioactive contaminants and must be capable of being washed free of them no worse than the covering material; 3) The glued bond must possess sufficient resistance to radiation. An experimental evaluation was made of certain general and special properties of type PED-B glue. Among the parameters considered were the mechanical properties (with description of the test equipment employed) and the sorption-desorption properties of the glue with respect to radioactive isotopes, as well as its ability to withstand radiation. A description of the technological process to be followed in fastening formula 57-40 masticated rubber shielding with PED-B glue is also given. It was found that this glue, which is manufactured on an incombustible methylene chloride solvent has good adhesion characteristics not only to the masticated rubber, but also to cement, metals, wood and other construction materials. It is not dangerous from the

Card 2/3

ACCESSION NR: AT4016996

point of view of explosions. While the residual radioactivity accumulated by glued bonds was found to be very high (up to 60%), it was found that by lacquering the bonds with high-deactivating lacquers (VKHL-4000, KHSI) this residual activity could be reduced to a level close to the value of this parameter for the basic shielding material. The authors also determined that the bonds preserve the required strength under the effect of a dose of gamma-radiation to 100 Mrads. Orig. art. has: 3 tables and 6 figures.

TITLE: The use of films with adhesive layers for shielding against radioactive contamination

SOURCE: Zashchitnye pokrytiya v atomnoy tekhnike (Shielding in nuclear engineering); sbornik statey. Moscow, Gosatomizdat, 1963, 93-97

TOPIC TAGS: radioactivity, radioactive contamination, surface shielding, radiation shielding, polyethylene film, polyvinylchloride film, adhesive, roll film material, nuclear shielding

ABSTRACT: One of the types of films used for surface shielding is roll-film material with a non-drying, adhesive layer applied to one side. The use of films is said to simplify considerably the technology of gluing the surfaces to be protected, while eliminating the use of harmful and flammable solvents. As a result of experimental work, such roll-film materials for shielding purposes against radioactive contamination were developed on a polyethylene and polyvinylchloride base. The following considerations were considered

fundamental: 1) the formula of the base film must provide minimal sorption and easy desorption (deactivation) of radioactive contaminants; 2) the formula of the non-siccative glue must have good adhesion to various construction materials: concrete, metal, plaster; 3) the films with the adhesive layers must be capable of easy application to the surfaces to be shielded and, in case of necessity, easy removal and replacement. The authors discuss other specifications both of the films and of the adhesive glue layers, with special attention to a polyethylene film (0.1 - 0.14 mm in thickness), which may be washed free of radioactive contamination very easily, and an easily deactivated polyvinylchloride film (0.2 - 0.29 mm in thickness) of a specially selected formula. On the basis of experiments, the authors reached the following conclusions: 1) Polyethylene and polyvinylchloride films with an adhesive layer may be recommended for use, in working with radioactive materials, as temporary, easy-to-replace, shielding for vertical surfaces and for laboratory equipment, as a protection against radioactive contaminants and corrosion; 2) The formulas chosen for the base film provide deactivation of the protective shielding up to maximum permissible levels with mean levels of contamination. The polyethylene films showed particularly good deactivation capability; 3) The formula selected for the glue layer provides good strength

of adhesion of the films to metallic surfaces and satisfactory adhesion to cement and plastered surfaces, if these surfaces are prepared in accordance with certain recommendations discussed in the article. Orig. art. has: 1 figure.

TITLE: The selection of optimal characteristics of apparatus when recording head waves from the crystalline basement

SOURCE: AN SSSR. Izv. Seriya geofizicheskaya, no. 5; 1964, 636-653

TOPIC TAGS: seismic prospecting, seismic wave, frequency spectrum, microseism, low frequency oscillation, seismograph NS 3

ABSTRACT: The optimal frequency for obtaining useful signals from any reflecting surface depends on many factors and is generally determined experimentally. The authors have made special studies to find the optimal range of frequencies when recording head waves from the crystalline basement in the Moscow region. Investigations were made with low-frequency seismic-prospecting equipment developed at the Institut fiziki Zemli AN SSSR (Institute of Physics of the Earth AN SSSR), the low-frequency NS-3 seismograph, which permits recording of frequencies down to 3 or 4 cycles. On the frequency spectrum, the maximum in the useful part was found at 6-7 cycles. The middle of the spectrum shows intense low-frequency oscillations caused

TITLE: Modified waves forming on a thin layer

SCURCE: AN SSSR. Izvestiya. Fizika Zemli, no. 12, 1965, 13-20

TOPIC TAGS: longitudinal wave, wave mechanics

ABSTRACT: In field investigations it has been possible to detect clear modified refracted waves of the PPPS type, forming at the time of incidence of a longitudinal wave on a thin layer with decreased velocity ($\epsilon_1/\epsilon_2 = 1.5-2.0$). The ratio of the thickness d of the layer to the length λ of longitudinal waves in the layer in such cases varies in the range 0.1-0.2 to 0.6-1.0. It has been established that for recording the mentioned modified waves it is better to use an interval of higher frequencies than used in recording modified waves not related to thin layers. It was found that there is a good similarity of the results obtained by theoretical computations and the experimental data on the ratio of amplitudes of modified and uniform longitudinal waves.
