Author : Ivanovic, Dragisa M.
Inst Title : -
Title : Solution of the Problem of Penetration Through Potential Barriers with the Aid of a Certain New Quantity, Which Can be Called the de Broglie Impedance
Orig Pub : Publ. Electrotehn. fak. Univ, Beograd. Mat. i fiz., 1958, No 17, 6s., il.
Abstract : A new physical constant, $\chi = \mu_0 v$, which is called the de Broglie impedance, is introduced (v -- velocity of the particle, μ_0 -- magnetic permeability of the medium). This quantity is analogous to the electromagnetic impedance $Z_0 = \sqrt{\mu_0 / \epsilon_0}$ in the case of propagation of electromagnetic waves (ϵ_0 -- dielectric constant), or the acoustic impedance $Z = \rho c$ in the case of propagation of sound waves (ρ -- density of the

Card 1/2

Abs Jour : Ref Zhur Fizika, No 1, 1960, 188

medium, c -- velocity of sound). The solution of the problem of penetration through a potential barrier upon going from one medium to another reduces to the substitution of de Broglie impedance in known formulas for the reflection and transmission of light (or sound) instead of the electromagnetic (or acoustic) impedance. -- G.Ye. AUTHOR: Ivanovich, K.A., Professor, President of the Preparatory Commission for the International Seminar for Students of Agricultural Vuzes.

TITLE: A Conversation on Two Important Agricultural Problems (Razgovor o dvukh vazhnykh problemakh sel'skogo khozyaystva)

PERIODICAL: Vestnik Vysshey Shkoly, 1957, # 9, pp 83-86 (USSR)

ABSTRACT: The author gives a description of the international seminar of agriculture students during the VIth World Youth Festival in Moscow. About 170 persons took part representing 44 countries. Professor Karoi Kolbai (President of the Hungarian University of Agriculture), Professor Kurt Oberndorf from the German Democratic Republic, Soviet scientists: Academician N.V. Tsitsin, Professor G.M. Loza and others, were present.

Two problems were dealt with: The increase of grain quantity and quality, and higher agricultural training.

Academician N.V. Tsitsin gave an account of the grain economy in the USSR. A discourse about his experience in the field of hybridization was heard with great interest. Syu-Shu-syun, a delegate from China lectured on agriculture in his country. Other reports were made by: Ye, Sizenko, of the Timiryazev Academy, Diuori, from North Africa, and the Canadian Frank Sudo.

K.O. Ivanovich spoke about agricultural education and practical training. He answered many questions submitted by the audience.

Card 1/2

A Conversation on Two Important Agricultural Problems

3-9-27/31

V. Pungan, a young Rumanian scientist, gave information on the agricultural training in Rumania. There are 7 agricultural vuzes with 17 faculties. The training period comprises 5 - 5½ years. One year of practice is compulsory before entering the vuz. About 80% of the students receive scholarship.

Horatio Fernandez (Goratsio Fernandes) of Argentine and Abd-al-Azim Makhemed from the Sudan informed the audience of training methods in their countries. Representatives from Tunis and Poland took part in the debate. The seminar members spent one day at the Moskva Agricultural Academy imeni K.A. Timiryazev.

TITLE: Ways of Improving the Teaching Process (Puti uchvershenstvo-vaniya uchebnogo protessa) Practical Training Under Actual Conditions (Proizvodstvennoye obucheniye - v real'nyye usloviya)

PERIODICAL: Vestnik Vysshey Shkoly, 1958, # 4, pp 38-41 (USSR)

ABSTRACT: The Moscow Agricultural Academy imeni Timiryazev's training and experimental farms and its scientific research institutions serve as a basis for student practical training. The experimental stations for husbandry, vegetable growing, fruit cultivation, forestry, zootechnics, etc. are situated on the academy game reserve of about 700 hectares. Six training and experimental farms, located in 4 oblasts of the RSFSR, are attached to individual faculties for training and scientific research. They comprise a total of 14,000 hectares. Experimental fields and water basins have been established.

For the subject "Agronomy", 126 weeks have been assigned for theoretical work and 64 weeks for practical training. The practical training is then described. Some deficiencies in this practical training, such as poor organization, are

Restoration of metabolic balance through a jejunal tube. Med. int.,
Bucur. 10 no.4:555-564 Apr 58.

1. Spitalul "Bernat Andrei", Clinica chirurgicala, Bucuresti.
(BODY FLUID BALANCE

maintenance by admin. of fluids through jejunal tube, comparison
with parenteral method.

Serological analysis of antianthrax sera by means of synthetic ascontigens. G. Ivić Jović and V. Baćević (Magyar Orv. Árck. 1938, **39**, 469-479).—*p*-Aminobenzoylethamic acid, *p*-aminobenzoyl-*d*-aspartic acid, *p*-aminoglutamic acid and *p*-aminoadip-anilide were treated with horse or human serum-protein after diazotisation. The immune serum from rabbits treated with the *d*-glutamic acid azoprotein of horse serum gave a highly sp. pptd. of azoprotein produced from human serum-protein. Various dilutions of these azoproteins were tested with anthrax immune sera containing capsular antibody. The immune sera irreversibly pptd. the *d*-glutamyl acid azoprotein. No apparent reaction occurred between the immune sera and the azoproteins containing radicals other than *d*-glutamyl acid. A. W. M.

The occurrence of the polypeptide of *d*- α -glutamic acid in nature. Chemical investigation of the substance of the capsules of the bacillus of anthrax. György Bruckner, Jr., György Ivánovics and Margit Kivacs Oskolcs Mária. "Chem. Polym." 43, 131-146 (1989). Acid hydrolysis of the capsules of anthrax bacilli yields *d*- α -glutamic acid in significant amounts. The immune specific substance of these capsules could be sepd. and purified.

The same substance can be sepd. much more easily from other spore-forming bacilli of the mesenteric type. As the heavy-metal salts (e. g., the Cu salt) of this substance are insol. in water, ptnm., and electrodialysis lead to a rather

pure prepn. This substance is amorphous like gelatin, very hygroscopic, sol. in water to a strongly acid soln., has optical activity and contains about 10% total and 0.2-0.5% amino N. The acid hydrolysis of this substance leads to *d*(-)-glutamic acid-HCl. Probably the substance is a high-mol. compd. consisting of *d*(-)-glutamine and groups having a polypeptide-like structure. For the prepn. by means of mesenteric bacilli *L*-asparagine and *L*-glutamic acid seem to be the most suitable nitrogen nutrients. As in the proteins of cancerous tumors only glutamic acid is racemized in the highest degree, the occurrence of this acid in other natural compds. has an importance from the points of view of both biochemistry and cancer investigations.

Soluble derivatives of sulfanilamide. Gyorgy-Viszak, Univ. Szeged, Hungary. Magyar Akad. Kutat. önköltségi Munkái 15, 462-4 (1943). - β -Alanine (2 g.) with β -AcN $\text{II}(\text{CH}_3\text{SO}_2)_2$ (I) gave crystals of β -N-(β -acetylulfanilamido)propanoic acid (II). The crystals obtained by refluxing II in dil. HCl and cooling were dissolved in 10% NaOH and as much 10% HCl added as necessary to give 1.9 g. crystal. β -ulfanilamidopropanoic acid (III), with 1 mol. H_2O_2 , m. 117°. Taurine in 10% NaOH was boiled 15 min. with I, giving crystals of 2-sulfanilamidoorthanesulfonic acid-HCl (III), m. 200° (decompn.). To δ -aminosalicylic acid in 10% NaOH was added according to a detailed procedure to give crystals of 4'-hydroxy-5'-carboxysulfanilamide (IV), m. 263° (decompn.). II, III, and IV have definite therapeutic effects. II crystallized from 25% alc. with 1 mol. H_2O_2 and is partially sol. in water, easily sol. in dil. NaOH; III crystallizes from concd. HCl in colorless needles and dissolves easily in water; IV crystallizes from 30% alc. in colorless needles and dissolves easily in dil. NaOH.

Raphanin, an antibacterial principle of the radish (Geo. Ivánovics and Stephan Horváth (Univ. Szeged, Hungary). Nature 160, 207-8(1947). Aq. exts. of radish seeds, when added to plates contg. *Staphylococcus* and *Hact. coli*, gave a very marked zone of inhibition in both cases, while exts. of radish roots and leaves did not affect the growth of the bacteria. This antibacterial principle was isolated as a liquid from the aq. ext. of radish seeds

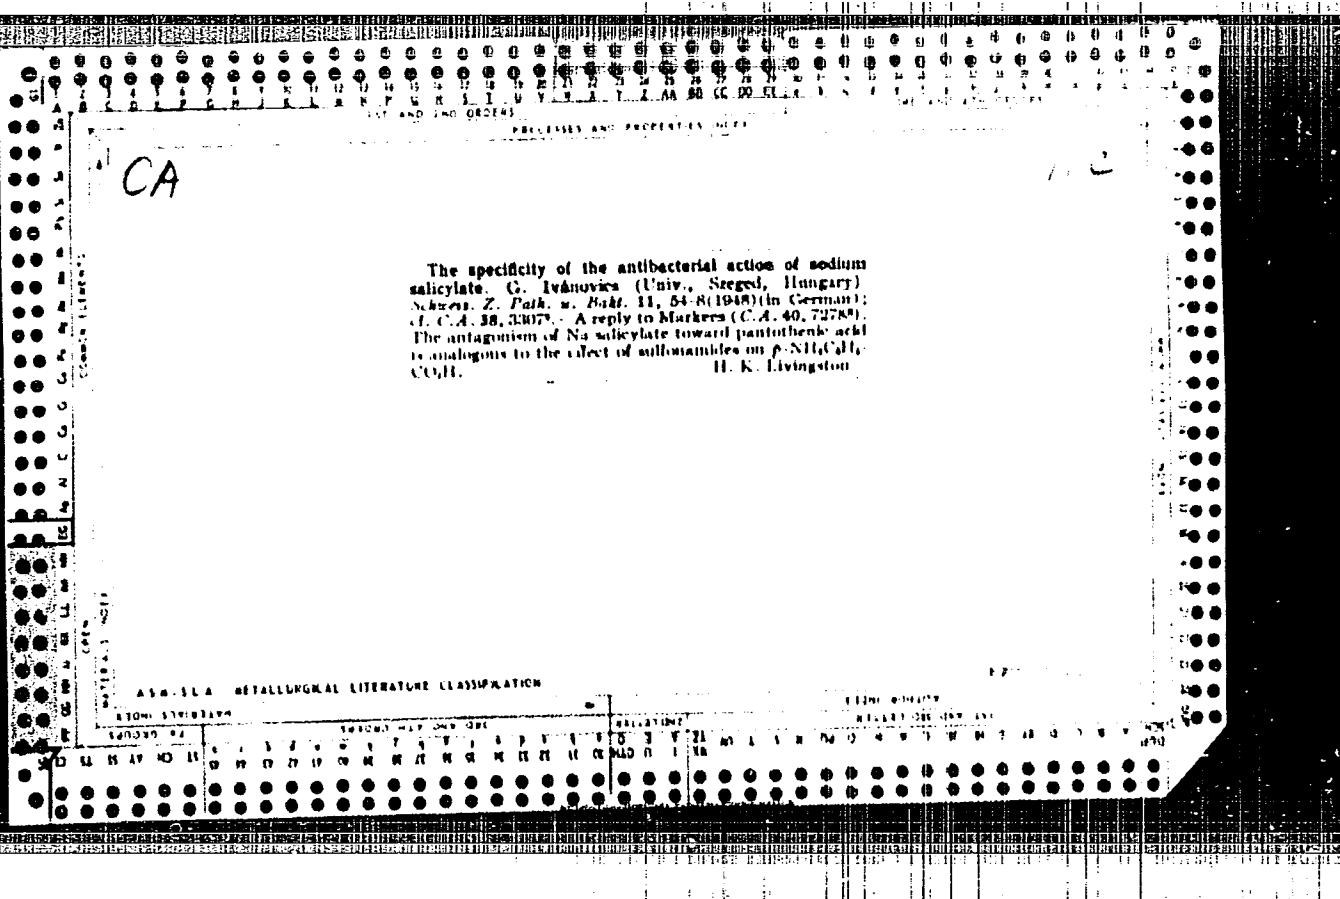

and named raphanin. It is heat-resistant; b. p. 135°; yield is 3 g. per kg. of seeds. It is freely sol. in water, ethanol, butanol, butyl acetate, amyl acetate, and HCOH; moderately sol. in ether, and slightly sol. in petr. ether. Formulae: $C_9H_{14}N_2O_8S$ and $C_{11}H_{16}N_2O_8S$. It is neutral; $[\alpha]_D^{25} = -141^\circ$; it is stable between pH 3 and 8. It was crystd. by shaking with 0.1 N baryta and neutralizing with H₂SO₄; recrystd. from ethanol and then from water. This cryst. substance had m.p. 102-3° at decompr.; formula $C_{11}H_{16}ONS_2$. A 1 mg. per ml. soln. of raphanin gave a zone of inhibition with various bacteria. Raphanin is highly active in preventing the germination of various plant seeds and in hindering the growth of tissue culture from rabbit testicle. It is moderately toxic to mice and to isolated frog heart. Dorothy A. Meyer

- Some observations on the antibacterial action of sodium salicylate. G. Ivánovics, J. Csabi, and E. Dierdorff-Hung, *Acta Physiol.*, 171 (1958), p. 1-42, 4614. Na salicylate in amounts of 0.01-0.0001 M considerably diminished the multiplication of *E. coli*. This effect could be antagonized by adding pantothenic acid and some amino acids even if the cells had already been exposed to Na salicylate action for some time. Na salicylate in amounts of 0.05 M or above gradually destroyed the bacteria in an irreversible manner. There was no sharp line between the modes of action of Na salicylate. The bacteriostatic action of Na salicylate is due to the inhibition of the synthesis of pantothenic acid in bacteria. István Fényi

The effect of *p*-aminosalicylic acid on tubercle bacilli.
Gyorgy Ivánovics, *Orosz Helyap* 90, 299-92 (1949); cf.
C.A. 43, 6070c. The tuberculostatic effect of *p*-aminosalicylic
acid (I) in Dubos culture medium seemed to be nearly
equal to that of streptomycin. The effect of its derivs. and
similar compds. was much lower. One mol. I counteracted
the effect of 3-4 mols. *p*-aminobenzoic acid. Sodium sali-
cylate (II) in $\frac{1}{1000}$ M concn. impeded the tuberculostatic
effect of I although both agents alone were actively tuber-
culostatic. Pantothenic acid did not influence the slight
tuberculostatic effect of II. The sensitivity of streptomycin I
resistant tubercle bacteria, was also unchanged towards I
