Budapest, Orvosi Hetilap, Vol 104, No 43, 27 Oct 63, pages 2050-2051.

Abstract: [Authors' Hungarian summary] The simultaneous occurrence of the two disorders is reported by the authors. In this connection it is pointed out that, because of the great variety of clinical symptoms, the early recognition of the tumor presents a great problem. 1 Hungarian, 5 Western references.

3017. EXPERIMENTAL FOETAL ERYTHROBLASTOSIS IN RABBITS WITH SIMULTANEOUS ACUTE HAEMOLYTIC ANAEMIA OF THE FEMALE - Experimentálna fetálna erytroblastóza u králikov pri súčasnej akúnej hemolytickej anémii samičky - Iványi P., Tomášková M., Ondruš B., and Smetana K. Krajskéj Transt-Stanice pri KUNZ, Nitre; Biol. Št., Lék, Fak., KU, Praha - BRATISL. LEK. LISTY 1958, 38(II)/8 (457-466)  
Tables 3 Illus. 1

In pregnant rabbits, acute haemolytic anaemia was produced by the injection of iso-immune group-specific rabbit serum. Sufficiently strong doses (2-4 ml.) of the serum led to death after protracted shock. The offspring in the uterus, showing also incompatibility towards the antibody, was seriously affected (erythroblastosis foetalis). The principal histopathological changes were found in the liver. The

overall amount of erythropoietic foci was not strikingly increased though the proliferation of younger elements (proerythroblasts) was marked. No fundamental differences were found between individual litters in the histological picture. No relationship of the findings in the young with the simultaneous haemolytic anaemia in the mothers could be found.

Orig Pub: Magyar alatorv. lapja, 1957, 12, No 3, 73-76.

Abstract: The etiological agent of the disease is Clos-  
tridium perfringens, type C. Especially sus-  
ceptible to infection are piglets in the age  
group of one to two weeks old. It was demon-  
strated that it is impossible to eliminate the  
infection by applying hygienic measures. Treat-  
ment with sulfamides and antibiotics proved in-  
effective; however, hyperimmune sera used for  
piglets and vaccination of sows gave quite

Bacteria and Fungi.

Abs Jour: Ref Zhur-Biol., No 8, 1958, 35829.

Abstract: satisfactory results. For the preparation of the vaccine strains were chosen which have a high degree of toxigenic capacity. Such strains were formalinized, and then calcium aluminum sulfacte was added in order to raise pH to the 7.4 level. Harmlessness of the vaccine was tested on mice, guinea pigs and pigs. The vaccine proved to be effective when it was administered twice subcutaneously in a dose of five milligrams (at an interval of three weeks) to sows during their second or third month of pregnancy (but not later than three weeks before farrowing). After vaccination of the sows, the piglets acquire passive immunity through the

## ABSTRACT:

of Prague 8 were investigated in 1961; incidence of psychoses, abuse of alcohol, and other psychic disorders were studied. In 100,000 people 958 cases of psychiatric disorder were found; 134 were psychoses, 159 abuse of alcohol, 665 psychic disorders. Incidence with regard to age and sex is discussed. Difficulties in making satisfactory diagnosis in individual cases is described. Preventive psychiatry is discussed. Orig. art. has: 1 figure and 4 tables.

SOURCE: Ceskoslovenska psychiatrie, no. 3, 1965, 145-155

TOPIC TAGS: scientific research, psychiatry, medical research facility

ABSTRACT:  
In a period of 6 years were investigated methodologically; an epidemiological study of all the in-patients and out-patients that were treated in psychiatric institutions of one of the Prague districts was evaluated. The district has 80,000 inhabitants; all of the 3565 patients treated at the psychiatric facilities lived in the district. Four kinds of methodological problems were investigated: 1. making sure that the sample is complete and using all the sources of evidence; 2. making sure that all the patients resided in the investigated area; 3. correct diagnosis of the psychotic disease; 4. making sure that the diagnostic examinations of out-patients (2407) were correctly recorded and filed. TITLE: Annealing of Magnetically-soft Iron (Otzhil magnitno-myagkogo zheleza)

PERIODICAL: Metallovedeniye i Termicheskaya Obrabotka Metallov,  
1959, Nr 1, pp 39 - 41 (USSR)

ABSTRACT: In the heat-treatment laboratory of the Leningrad Polytechnical Institute imeni M.I. Kalinin, a regime was developed for annealing commercially-pure iron so as to ensure favourable magnetic properties. The influence of the annealing temperature on the magnetic properties was studied of cylindrical specimens, 12 mm dia, 50 mm long and by measuring the permeability  $\mu$  of toroidal specimens cut from 15 mm hot-rolled sheet. The specimens were annealed at 900, 925, 950, 975 and 1 000 °C for three hours; this was followed by cooling of the specimens in the furnace down to 200 °C and from that temperature onwards, cooling in air. To prevent excitation, the specimens were placed into iron boxes and covered with iron chips. In Figure 1, the influence is graphed of the annealing temperature on the size of the ferrite grain and on the coercive force of the iron,

Card 1/3

Annealing of Magnetically-soft Iron

SOV/129-59-1-9/17

determined by a ballistic method; 950 - 960 °C proved to be the optimum annealing temperature at which the lowest coercive force was obtained. In Figure 2, the results are graphed of experiments aimed at determining the influence of the duration of the annealing on the grain size and the coercive force; the greatest softness is obtained if the iron is annealed for 7-8 hours. In Figure 3, the results are graphed of the influence of the cooling speed on the grain size and the coercive force. For obtaining a high impact strength and the maximum possible magnetic softness of commercially-pure iron, the material should be cooled slowly in the furnace to 350 - 400 °C. Following that, the material should be removed from the furnace and allowed to cool more rapidly in air.

TITLE: Sulphiding in baths without using cyanide salts

PERIODICAL: Metallovedeniye i termicheskaya obrabotka metallov,  
1961, No.8, pp.56-58

TEXT: Sulphiding is not used on a wide enough scale in the Soviet Union in view of difficulties encountered with application of cyanide salts. To overcome these difficulties NIITavtoprom developed a technology which does not involve the use of cyanide salts. Gas sulphiding did not yield positive results due to the fact that toxic gases with an unpleasant smell formed. In the process of liquid cyaniding (at 560-580°C) the poisonous salt KCN is substituted by KCNO and the process of sulphiding will proceed according to the reactions

Card 1/3

Sulphiding in baths ....

S/129/61/000/008/015/015  
E073/E535

and during the process carbon and nitrogen will also form in accordance with the reaction

In NII Tavtoprom the cyanate was obtained from the two salts: urea (55%) and potash (45%) in accordance with the following reaction

The urea and the potash are introduced in small quantities into an iron crucible heated to 350-380°C. During the fusion process sal ammoniac and carbon dioxide are generated and a 98% potassium cyanate is obtained. When the crucible is three-quarters full the temperature is increased to 500°C and sodium sulphide is added. The bath is ready for operation when the sulphide sulphur in the melt reaches 0.2-2%. The content of potassium cyanate in the melt should not be below 30%. The effect of this process was tried out on piston rings in repaired truck engines. It was found that by means of this treatment the service life of the

Card 2/3

Sulphiding in baths ...

S/129/61/000/008/015/015  
E073/E535

piston rings increased from the standard 10-12000 km to 30000 km. Details are given on the sequence of operations of this sulphiding process. For components which must not be heated to temperatures exceeding their tempering temperature, a chemically active low temperature bath was developed consisting of 90% KCNS + 10% NH<sub>4</sub>CNS. The sulphiding process is carried out in a gaseous medium formed by the decomposition of ammonium thiocyanate salts. As a result, the melt retains its fluidity and no ballasts form. This process is suitable, for instance, for worm gears and other case-hardened components.

installation  
Periodical : Neft. khoz., 33, 5, 58-62, My 1955  
Abstract : In the reconstruction of an oil-refining installation  
its capacity has been increased and higher fractions  
obtained. The flow diagrams of the old and the  
reconstructed installations are shown. The main  
difference is that in the new installation the  
charging stock enters by two different lines, one  
part (about 55%) through heat exchangers and the  
other part (about 45%) through the coils of the  
vacuum line furnace.

AUTHOR: Ivanyukov, D. V., Engineer SOV/119-59-8-2/15

TITLE: On the Experience Made by the Automation and Mechanization of Industrial Processes at the Moscow Petroleum-working Factory

PERIODICAL: Priborostroyeniye, 1959, Nr 8, pp 4-6 (USSR)

ABSTRACT: In the introduction the percentage according to which the personnel is distributed in a petroleum-working plant is given. According to these data 30 % of the workers operate technological apparatus, 20 % work the containers, pipelines, pumps and similar installations, 7 % supervise power economy, 10 % carry out laboratory controls, 5 % operate control- and measuring instruments, 14 % carry out repairs, and 14 % are available for various kinds of work. It was found that the degree of automation of various processes varies, and that, above all, transport-operations and laboratory controls must be automatized. It is stated that the collective of the Moskovskiy neftepererabatyvayushchiy zavod (Moscow Petroleum-working Factory) has improved all technical-economic indices, and these improvements are given for the years 1952-1958. This progress was attained by the introduction of new technical methods. As the automation of individual units does not lead to an essential improvement of operating efficiency, as was

Card 1/3

On the Experience Made by the Automation and SOV/119-59-8-2/15  
Mechanization of Industrial Processes at the Moscow Petroleum-working Factory

shown by experiments in the above factory, it is suggested that general automation be introduced. This work is being carried out in the same plants on the basis of data published by the former Ministerstvo neftyanoy promyshlennosty (Ministry of the Petroleum Industry) and the Ministerstvo priborostroyeniya (Ministry of Instrument Building). The most important work is at present the building of a central switchboard for the control, regulation, and signalization of technological apparatus, operations etc. Of 210 automatic regulators, 75 % were installed on the switchboard, so that 46 % of the personnel is free for other work. Furthermore, the individual branches of the plant and their automation are discussed and two control schemes are shown (Figs 1, 2). It was decided that the factory be rebuilt by the collaboration of Giprogaztopprom (State Institute for the Design and Planning of Synthetic Liquid Fuel and Gas Establishments) with the Konstruktorskoye byuro neftyanogo i neftekhimicheskogo priborostroyeniya SKB VNII (Design Office of the Petroleum-and Petroleum-chemical Instrument-building SKB VNII) with the Nauchno-issledovatel'skiy institut NIITeplopribor (Scientific Research Institute NIITeplopribor) and the factory "Tizpribor".
