TITLE: Czech patent no. 3391-64

SOURCE: Vynalezy, no. 9, 1965, 12

TOPIC TAGS: voltage regulator, rectification, variable resistor, resistor, alternating current, electronics, electric current

TRANSLATION: The control element for the magnetic voltage regulator has a three-phase alternator voltage which, when rectified by the first rectifier, generates voltage directly proportional to the alternator terminal voltage on the first resistor. At a conjugate, the alternator voltage is connected in series with another rectifier of the winding of the differential transducer, whose one control winding is bridged by a variable resistor. The current rectified by the second rectifier is fed to one control winding of the transducer whose working current, rectified by the third rectifier, passes through the second resistor where it generates a reference voltage which is subtracted from the metered voltage on the first resistor. The second control winding of the two transducers is connected in series and fed by a fourth rectifier, characterized by the fact that the rotor of a booster is connected to its al-

AUTHOR: Janecki, Sławomir (Gdańsk)

TITLE: Flat stationary vibrations of a gaseous medium forced by the action of the source of mechanical energy

SOURCE: Polska Akademia Nauk. Instytut Maszyn Przeplywowych. Prace. no.9, 1962, 141-156

TEXT: An attempt is made to solve the problem of self-excited vibrations of an elastic body from the point of view of a wave energy exchange between the compressible medium and an elastic body immersed therein. This presentation permits the introduction of a mathematical model of a point source (sink) of mechanical energy, placed in a planar, ideally compressible medium. Utilizing the theory of linearization applicable to small perturbations, the behavior of a planar elastic space in the presence of a pulsating source (sink) of energy and the properties of the reactive forces present in this space are studied. The velocity distribution is circularly symmetrical. The determination of the velocity distribution for a point source of mechanical energy was carried out by defining first the total power of the

AUTHOR: Janecki, Slawomir (Gdansk)

TITLE: Vibrations of a cylinder surface in an unlimited gaseous medium

SOURCE: Polska Akademia Nauk. Instytut Maszyn Przeplywowych. Prace, no. 17, 1963, 39-61

TOPIC TAGS: vibration, cylinder surface, unlimited gaseous medium, elastic body, energy exchange, forcing edge, velocity distribution, rigid cylinder, deformable cylinder, linearization, maximum damping, resonance

ABSTRACT: The paper is a continuation of the attempt to solve the self-excited vibrations of an elastic body from the viewpoint of the wave exchange of energy between an exact, ideal gaseous medium and an elastic body within it (author's earlier paper: "Stationary plane vibrations of a gaseous medium forced by the action of a mechanical-energy source", Prace Instytutu Maszyn Przeplywowych, No. 9, PWN, Warsaw-Poznan, 1962). It examines the reactive forces produced by the movement of points on a cylinder surface in an initially immovable gaseous medium. The movements of the forcing edge with small amplitudes are described by a continuous and differentiable distribution of the velocity on a cylinder of constant radius. This assumption

Card 1/3

ACCESSION NR: AT4039445

makes it possible to find solutions for the vibrations of both rigid and deformable cylinders. On the basis of the linearized theory for small disturbances, it determines the characteristic of the reactive forces reducing to two coefficients dependent on the initial parameters of the state of the gas, the shape and frequency of the vibrations of the forcing edge. Linearization of the problem permits adoption of the edge condition, the agreement of the normal components of the gas velocity and the components of the velocity of the forcing edge, on the undeformed (immovable) surface of the cylinder, instead of on its instantaneous position during the vibrations. After the example of rigid-cylinder vibrations, it also examines the possibility of so choosing the design parameters of an elastic system with one degree of freedom that there will be maximum damping of the vibrations in resonance when this system is placed in an exact gas. It is found that the reactive forces of the gaseous medium depend linearly upon the acceleration and velocity of the vibrations of the gas particles. The forces proportional to the acceleration are inert, with a coefficient of proportionality depending upon the radius r_0 and the frequency of vibrations of the forcing edge, as well as upon the initial parameters of the state of the gaseous medium p_0 and ρ_0 . The forces proportional to the velocity are nonconservative forces of viscous friction with a damping coefficient depending on those parameters. In conclusion, the paper gives an example of forced vibrations of a rigid cylinder elastically attached and making movements with one degree of

Card 2/3

ACCESSION NR: AT4039445

freedom in an immovable gaseous medium. The paper is an introduction to a more extensive one devoted to self-excited vibrations in turbines, to be examined on the basis of the wave theory. Orig. art. has: 8 figures, 2 tables and 113 formulas.

Abstract: Computer evaluation of data obtained in the study of acute infarct of the myocardium is described. 280 indicators were used which allowed the use of 2200 characteristic codes. A 50 page code was prepared. All 280 indicators use numbers 1 to 9, and data on one patient are contained on 4 cards. The first problem is the determination of the frequency of correlation complexes of the most important signs of an acute myocardial infarct. 2 Western references

A description of 11 patients is given. In cases of spastic infantile paralysis treatment must be carried out by an orthopaedic surgeon, a neurologist and a physical training expert. Before operation co-operation with the patient must be assured. In psychically altered children, therefore, it must not be carried out. More success is to be expected in hemiplegias than in diplegias. Accompanying extrapyramidal symptoms, if slight, are not a contraindication.

"A Device for the Determination in Soil of Fast Dissolving Plant Food by Means of Repeated Extraction"

Belgrade, Jugoslovensko Pronalazastvo, Vol 7, No 76-78, Apr-Jun 66, pp 15-16

Abstract: Because of the neutralization of the acid extraction fluid in soils rich in bases, the single extraction procedure for the determination of fast dissolving plant food in soils may not be very accurate. Consequently, Yugoslav patent No 24 086 describes a simple device for soil plant food determination by means of repeated extraction using CO₂. The resulting method is very fast and suitable for field work.

JANEKOVIC, GJURO

measurements, either gradually or rapidly, and thus the potential adjusts itself slowly, or even shows a completely erroneous value. This will cause an error of 0.25 pH units. In order to catch this error, one must always run measurements in parallel. It is good to check the electrode. If it does not show the right potential in a standard buffer solution after 1-2 sec., it must be cleaned with soft filter paper. Comparative measurements with the I and the glass electrode show that at floating potentials only the very 1st potential is the right one. The I electrode will show the right potential 10 sec. after the I addn. but this time is unquitable for soil pH detns. in series; 30 sec. after the I addn., the error will be +0.1, 60 sec. after the I addn. it will be +0.2 pH units. Thus, it is suggested for practical purposes to take the reading after 20 sec., which is easily done, then the error is not yet too great. But one should take the reading at 30 sec. too, in order to discover if a sample is reaching the equil. potential slowly. In the presence of $N Ca(OAc)_2$ or $N NaOAc$ the potential of the I electrode will be surprisingly const., even for samples which in KCl or H_2O will show heavy changes of potential; this makes the I electrode suitable for detg. the Ca demand of soils in series according to the method of pH measuring in soil-acetate suspensions.

JANKOVIC, G.

Chem ✓ Potassium chloride bridge with automatic regeneration of the diffusion membrane. Gjurc Janković (Agr. Forest Fac., Sarajevo, Yugoslavia). ~~Zemljopis i Biljka 1, 436-8 (1952).~~ The porous clay sheath used in the standard pH app. (which dips into the satd. KCl) causes an error of +0.08 pH units under most unfavorable circumstances (cf. preceding abstract). By substituting a ground glass part according to Irwing and Smith (C.A. 29, 665) for the clay sheath, this error can be completely eliminated; the glass retains enough of the KCl soln. to act as diffusion membrane. Werner Jacobson

Abs Jour : Ref Zhur - Biol., No 21, 1958, No 97158
Author : Houstek, J.; Janele, J.; Rubin, A.; Snobl, O.
Inst : Not given
Title : Bone Changes in Diseases of the Blood in Childhood.
Orig Pub : Caskosl. rentgenol., 1957, 11, No. 2, 86-99
Abstract : The skeleton of children with acute leukemia (166 cases),
chronic myelosis (11), lymphogranulomatosis (25) and
hemolytic anemia (21) was studied roentgenologically.
The changes in the form of lucid intervals, osteolytic
foci and periostosis were noted in 66% of cases, first
of all in the region of metaphyses, mostly in the bones
of the calf, distal metaphysis of the femur, distal
metaphyses of bones of the forearm and in the bones of
the wrist. In chronic courses, sclerotic changes were
