"Influence of Sideropenia During Pregnancy on the Red Cell Count of the Newborn."

Prague, Casopis Lekarů Ceskych, Vol 105, No 29, 8 Jul 66, pp 770 - 774

Abstract /Author's English summary modified/: Red cell counts of infants born to mothers suffering from sideropenic anemia and to mothers who developed anemia shortly after childbirth showed that there was no difference between the 2 groups up to an age of 12 to 15 months. 50 infants were included in each group. It appears that infants born to sideropenic mothers are not threatened by sideropenia in their first year of life. There is, however, a tendency to a marked iron deficiency; every case of sideropenia of mothers should therefore be treated by iron therapy. 4 Figures, 1 Table, 19 Western, 2 Czech references.

2249. BRIEF DESCRIPTION AND POWER SIGNIFICANCE OF THE PROPOSED HYDRO-ELECTRIC STATION OF PLANINA-VRH (SLOVENIA). Janezic, S. (Elektroteh. Vestnik, 1953, vol. 2, (5-6), 122-131). This station to be built for a water quantity of 63 m³/sec, a net head of 154.7 m corresponding to a power of 78.75 MW and an average annual energy yield of 248×10^6 kWh of which 116×10^6 kWh are regulable will comprise a storage reservoir, a pressure gallery of about 11.7 km length, a water chamber, penstock and the power house with a low water compensation reservoir. The station is intended to serve both for equalizing the seasonal and the daily load fluctuations. Graphs show the share taken by the hydro-electric non-storage river stations on the Drava, the Sava and the Soča, the Planina-Vrh storage plant and the thermal power stations in supplying energy over the whole year 1952 and during one day of that year. JANIAK, E.

Biochemical investigations on the fungistatic effect of *Pseudomonas aeruginosa*. J. Alkiewicz, Cz. Majewski, and E. Janiak (Munic. Hosp. No. L. Poznan, Poland).

Bull. soc. amis sci. et lettres Poznan, Ser. C, 5: 11-19 (1955) (in English).—Slightly water-sol. pyocyanine (I) was obtained by evapn. of a CHCl_3 ext. of *P. aeruginosa*. Pyocyanine sulfate (II) was obtained by acidification of the CHCl_3 ext. with 1% H_2SO_4 (with subsequent adjustment to pH 6 with 5% Na_2CO_3). Pyocyanine Na salt (III) was made by adjusting II to pH 8 with 5% Na_2CO_3 . These compounds inhibited the growth *in vitro* of fungi of the *Trichophyton* and *Microsporon* groups. I was most potent. Antihiotic PX was prepd. by adsorbing the Bacto peptone medium from *P. aeruginosa* on activated charcoal which was then extd. 4 hrs. with acetone acidified to pH 2.5 with H_2SO_4 . The acetone ext. was evapd., and the residue extd. with water. PX was fungistatic; traces of CoSO_4 increased its activity. It was crystal. to yellow-brown water-sol. rods, m. 153-1°. It was not identified, but it did not resemble I, II, or III. Vera C. Glocklin

Abstract: [Authors' English summary modified] Authors give the details of their study on the persistence in the blood and clinical effectiveness of the drug (see title) on various domestic animals against bacterial strains in them. It persisted longest in blood of cattle, least in pigs, and was effective against bronchopneumonia in calves, foals, piglets, and dogs, in the oedematous disease of pigs, and in inflammation of the mammary glands in cows, where it was administered directly to the inflamed area. There is one German reference.

6549. JANIĄKOWA A., JANIĄK T., OLEARCZYK J. and ZIEMNIAK J. Stacji Krwiodawstwa, Wrocław. "O aktywność trombolastycznej krwi konserwowanej. (Doniesienie tymczasowe). The thrombolastic activity of preserved blood POL. ARCH. MED. WEWNĘT. 1956, 26, 12 (1887-1890); Graphs 1

Using Quick's test for the thrombolastic activity it was found that fresh plasma of blood placed in the stabilizer, after its dilution, demonstrated a thrombolastic activity slightly higher than the activity of oxalated plasma. For approximately 7 days after withdrawal of the blood, a slight decrease in the thrombolastic activity was observed. This decrease became marked between the 7th and 14th days, ruling out all possibility of error in the method. The results obtained up to the present seem to indicate that in cases of haemorrhagic diathesis caused either by quantitative insufficiency or by functional insufficiency of the thrombocytes, blood preserved for 7 days has the same power of improving a haemorrhagic diathesis as fresh blood has.

5809. HAEMOPHILIA A RESISTANT TO TREATMENT - Hemofilia A oporna na leczenie - Janiakowa A. and Potoczek S. III Klin. Chor. Wewn. Akad. Med., Wrocław - POL. TYG. LEK. 1958, 13/20 (758-763) Graphs 6 Tables 2
A 20-year-old man developed strong, non-specific antibodies, which were difficult to identify, following repeated transfusions of homogenous blood in the course of recent years. The patient reacted to the transfusion of total blood and antihæmophilic globulins with aggravation of hæmatological changes and deterioration of the clinical condition. The first transfusions of fresh plasma brought about a short-lasting improvement which, however, was decreasing under the influence of repeated transfusions. The influence of hormonal treatment remains an open question.
