Method of controlling the dyeing process with azo dyes (see colour).  
 K. Janiszewski (*Fract. Ind. Polym.* 1958, No. 1, 1-7). Azo colour  
 azo dyes which form directly on the fibre by combining  
 naphthols with diazo bases. The process of dyeing consists (a) in  
 (a) saturating the fabric with the naphthol solution (inactive  
 constituent), and (b) development of the saturated fabric in a  
 solution of the diazo base (active constituent). Analytical methods  
 for determining (a) the ability of complex formation of the "in-  
 active" dye constituents (determination of anilide by saponification  
 with NaOH, iodometrically, or from its solubility in pyridine), and  
 (b) the active dye components by means of the diazo reaction,  
 are described, and their application in controlling the ratio of  
 naphthol and diazo base in the dye bath is considered. Titimetric  
 determination of the quantity of naphthol absorbed on the fibre  
 and photometric evaluation of the colour intensity, carried out on  
 the dye extracted from the material, are also discussed.

*Allen* ✓ Conditions for washing fabrics naphtholated after printing. Karol Janiszewski (Prace Inst. Włok., 1955, 4, No. 18, 18-21). The purpose of washing is to remove naphthol from places not covered by the pattern (i.e., to remove the reaction products of CO<sub>2</sub> and naphthol, as well as the excess of base not combined with naphthol and the thickeners used in printing dyes). After analyzing the washing process, examination was made of the properties (lathering and wetting power, stability to hard water, acids and alkalis, emulsifying and detergent power) of various Polish detergents. The removability of naphthol by washing was measured analytically and the degree of whiteness photometrically. Laboratory results based on the use "Sapono Alpha" and NaOH were confirmed under industrial conditions. The method eliminates the use of soap and makes it possible to obtain improved whiteness and quality.

✓ Janiszewski T. Recording the Time Required for Stopping Power Presses Equipped with Electronic Safety Devices.

„Pomiar czasu zatrzymywania się pracy sterowanej za pomocą urządzenia z fotokomórką“ (Prace Centr. Inst. Ochr. Pracy No. 1(6)), Warszawa, 1953, PWT, 13 pp., 18 figs., 5 tabs.

Electronic stopping devices using a photo-electric cell are being widely used as a means of safeguarding power press operators. Accurate determination of the time intervening between the cutting of the light beam and the moment of stopping the ram is of paramount importance from the point of work safety. The author deals with the methods of ascertaining arresting time in the case of presses equipped with electronic safety devices, and quotes the results of experiments with this method. The experiments were performed with a power press fitted with a dog clutch, in which the dog clutch had been modified so as to make it possible for the ram to be arrested in any position.

"Effect of Toxic Substances on Plant Tissues, as Determined with the Aid of Radioactive Phosphorus P<sup>32</sup>."

Bratislava, Biologia, Vol 18, No 7, 1963; pp 489-497.

Abstract [Russian Article, English summary modified]: Branch sections of *Prunus armeniaca* L and *Solanum lycopersicum* dipped into 0.14 M or 0.01 M NH<sub>4</sub>OH or 0.01 M fusaric acid with or without 10 ml. aqueous solution of P<sup>32</sup>-orthophosphoric acid. Radioactivity appeared in leaves within 2 hours, especially high in the apricot branches; at the 20th hour the activity was much higher in both experimental sets than in controls; at the 48th hour the apricot branchlets were still absorbing P<sup>32</sup>. Main mode of toxic action was ascribed to interference with closing of stomata. Two drawings, 5 tables; 1 Soviet, 4 Czech (whereof 2 unpublished) and 8 Western references.

Abstract: It was established that UV light speed up the  
aging of apple wine distillates by a 36 minute  
exposure to UV source at a distance of 21 cm.,  
and that of rhubarb wine by a 24 minute expo-  
sure to UV source at a distance of 10.5 cm.  
The samples which were subjected to UV exposure  
with a simultaneous aeration possessed the
