TITLE: Employment of ruthene in the chromatography of inorganic compounds

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24, 1962, 219-220, abstract 24D27 (Acta Univ. debrecen., v. 7, no. 2, 1961 (1962), 119-124 [Hung.; summary in Ger.])

TEXT: The reactions of 19 cations with rutin (I) on paper were investigated. The paper was impregnated with a 0.5% solution of I. The stain colours in visible and UV light are indicated as well as the minimum to be determined. The utility of these reactions for paper chromatography is investigated, both using paper treated beforehand with I and relying on subsequent detection by a solution of I. The first method is often applicable and yields a more marked separation. The best solvents proved to be methanol and ethanol, acidified by HCl (50 ml solvent + 5 ml 1 N HCl). The separation of the following triple systems is shown to be possible: Fe³⁺ - Ti⁴⁺

"Action of Mutagenic Agents on Auxotrophic Strains of Streptomyces"

Budapest, Acta Microbiologica, Vol 9, No 3, 1962; pp 273-284.

Abstract [English article; author's English summary]: The mutagenic effect on streptomyces auxotrophs of ultraviolet and X-ray irradiation and of some chemicals has been studied. From reverse mutations it has been concluded that ultraviolet and probably X-ray irradiation has an optimal mutagenic dose. With 9 auxotrophic strains it was shown that under the same conditions different gene loci reacted differently to the same mutagenic agent. --- Of the examined chemical substances a definite mutagenic action was exerted by acridine orange, streptomycin, hydroxylamine, phenyl isocyanate and 8-hydroxyquinoline. --- The maximum mutagenic frequency for survivors was 41.4×10^{-6} after ultraviolet irradiation (biological mutant arg 3⁻; frequency of spontaneous back mutation

TITLE: Biochemical studies on streptomyces aureofaciens IV. Studies on the ^{64, 35}
biosynthesis of chlortetracycline

SOURCE: Academia scientiarum hungaricae. Acta microbiologica, v. 11, no. 3,
1964, 203-210

TOPIC TAGS: biosynthesis, bacteria, bacteriology, streptomycin, carbon, chlorine,
tracer study, plant metabolism

ABSTRACT: It was shown by the use of C^{14} and Cl^{36} labelled compounds that, prior
to incorporation into chlortetracycline, the chlorine of organic substances is
converted into chloride. This is also valid for chlorpropanediol which, however,
was not utilized in the synthesis of chlortetracycline, in fermentations carried out

Card 1/2

L 15917-66

ACC NR: AP6008377

with the tetracycline-producing strain CDS-314. This led to the conclusion that chloropropanediol does not act as a direct precursor in chlortetracycline biosynthesis. Both strains used (B-28 and CDS-314) were able to convert the chlorine of organic compounds into chloride. The findings support the assumption that 2,5-dimercapto-1,3,4-thiadiazole inhibits the first, oxidative stage of biochemical chlorination. The genetic block to chlorination in strain CDS-314 is probably restricted to this first stage. A difference in the incorporation between C1 and C2 of the acetate indicated that C2 might take part as a C1 unit in this biosynthesis. Orig. art. has: 4 tables. [JPRS]

white lupine (an early maturing variety and
a transitional variety between early and late
maturing). The nutrition area for one plant
varied from 50 to 900 square centimeters. The
morphological characteristics are described.
The changes in the content of protein, alka-
loids, and fat were also studied. The seed
yield was evaluated according to the statis-
tical method of Bardatskiy. When lupine was
sown at the same time as spring grain, the
yield of seed was largest and best in quality;
the seeds were full and had a reduced content
of alkoids. Short spring frosts did not damage
the plants. The characteristics of the nutri-
tion area had a great influence on the habits
of the plants. The best nutrition area for

beans, the Viktoria field pea, and African vetchling. Harrowing after the appearance of shoots increased the seed yield by 10 percent and reduced weeds by 48 percent. Two hoeings gave the best results, increasing the yield by 48 percent, and even by 100 percent in some years, and eliminating 75 percent of the weeds. -- Ye. M. Tsvetayeva

AUTHORS: Olech, Leszek; Jaranowski, ZdzisławTITLE: Results of research on reversible and irreversible processes
in Mn-2n ferrites under the influence of thermal coercion

PERIODICAL: Przegląd telekomunikacyjny, no. 10, 1960, 309-310

TEXT: Tests were performed with toroidal cores of a ferrite containing 53% Fe₂O₃, 30% MnO, 17% ZnO, sintered at a temperature of 1,340°C for 3 hours and air-cooled, with a permeability of 700 Gs/Oe. Samples of 25 pieces were placed in thermostats at temperatures of 30, 60 and 100°C respectively. Intensity of the 1 kc test field was checked by means of voltage tests on a series resistor and amounted to 10 mOe. Temperature variations during the test did not exceed $\pm 0.5^\circ\text{C}$. Maximum temperature variation during the 6,000-hour test did not exceed $\pm 2^\circ\text{C}$. The curve of the function $\psi(t)$ which describes the irreversibility of the permeability change is shown in Fig.1. The result shows that the permeability change due to stationary temperature coercion closely follows the exponential law for

Card 1/3

Results of research on reversible ...

P/022/60/000/010/007/012
A222/A126

ferrites placed in a temperature of 100°C. The mean value for ferrites placed in a temperature of 60°C approaches the exponential only after about 1,000 hours. After the ferrites placed in a thermostat at 100°C reached a flattened course of the mean variance $\psi(t)$ they were subjected to additional thermal surge coercion. Reduction from 100°C to ambient temperature and subsequent short raising to 200°C caused a reversible change in permeability. There are 4 figures. X

56. Relations between microtectonics and rock movement
Jaray, (Hidnytskiy Lapok -- Vol. II (82),
1957, No. 16, pp. 505-516, 11 figs, 3 tabs)

The pressure arising in consequence of the crumbling of rocks as well as of the cutting up by cleavages exerts a substantial influence on the timbering and its costs. It is important to determine the stress arising in the rocks as well as the direction of rock pressure in order to utilize these data for dimensioning the permanent timbering of subsurface areas. In practice dimensioning is usually executed by employing theoretical formulas and practical methods. Divergences can be observed in the values of rock pressure obtained on the basis of the above theoretical method. They may be ascribed to the fact that not all of the physical properties have been taken into account, and that the rock has been assumed to be homogeneous and to possess isotropic properties. It can be demonstrated by laboratory tests that the rocks cannot be considered homogeneous and that under the influence of microtectonics their physical properties undergo changes. It can also be shown that the extent and evaluation of pressure depends on the dimensions of the timbering, on the stratification of the series and on the strength of the rock. The author describes laboratory tests conducted on natural and synthetic rock, which proved that their homogeneity did not exist in a metaphysical form. This statement is valid for eruptive rocks as well. Faults and fractures accompanied by visible or

GP

Jan
BC

J. J. Henry

hidden inhomogeneities are related to the inhomogeneity of rocks, and the author endeavours to infer the static and kinetic conditions of the rocks from the lithology. The correlation between microtectonics and the mechanics of the rocks can be established from the examples furnished, which also verify that it was correct to

take into consideration the tectonical elements in the solution of petromechanical problems.

Title : New Quality Properties of Hyghway Concrete Fillers.

Orig Pub : Magyar epitoipar, 1957, 6, No 9-10, 361-366.

Abstract : One of the shortcomings of concretes is the deviation between the projected and actual values of their rigidities. It is noted that the surface of the grains of the filler influences the rigidity of the concrete. To eliminate the indicated deviations and to increase the rigidity of the concrete, it is recommended that the quality of the filler be raised especially of the fine. By emphasizing the dependence between the ability to thicken and the surface of the grains of the

Abstract: A description of the Zeiss spectroprojector, and various possibilities for its utilization in mineralogy and petrography, are given. Nicol's prisms are used for the study of the microstructures of rocks in polarized light. The positive qualities of the instrument -- a large visual field, the possibility to compare up to 10 minerals simultaneously, etc. -- are indicated. -- Ya. Satunovskiy.
