1560. ROENTGEN INTERPRETATION OF CHRONIC PULMONARY HEART DISEASE - Przewlekly zespól plucno-sercowy w obrazie rentgenowskim - Jaroszewski F. II. Klin. Chor. Wewn. A. M., Poznań - POZN. TOWARZY. PRZYJAC. NAUK, WYDZ. LEK. 1958, 16/1 (49-80) Illus. 28

The author presents the results of roentgen examinations of 52 cases of chronic cor pulmonale. In 8 cases there were no radiological signs of changes in the lungs, while in the remainder inflammation, cirrhosis, emphysema of various degree and bronchosclerosis were found. Dilatation of the hilar arteries and prominence of the right ventricular conus were the earliest and most frequent symptoms. Prominence of the pulmonary artery is but of secondary importance. In about 1/3 of the cases examined enlargement of the right ventricle and in 1/7 dilatation of the right atrium in the anterior left oblique position were seen. Heart volume measurements (acc. to Jonsell's method) show the heart size to be in the vicinity of the upper limit of normal or to exceed it. Cor pulmonale incipiens may show little or no radiological signs. A comparison of roentgenograms and autopsy findings shows that enlargement of the right heart assumes various forms on radiological examination. A description of associated diseases and differential diagnosis of chronic pulmonary heart disease ends the paper.

TITLE: Attempt at the determination of the etiology of angina after smallpox vaccination

SOURCE: Przegląd epidemiologiczny, v. 19, no. 3, 1965, 331-334

TOPIC TAGS: disease incidence, virus disease, bacteriology, immunization

ABSTRACT: Virological and bacteriologic tests of one hundred children vaccinated against smallpox for the first time revealed that throat inflammation (swelling of mucuous membrane, transperance of vesicles) occurs in 70 percent of the cases, usually 5-7 days after vaccination. In some cases the pattern of the disease is more serious (pseudodiphtherial angina) and appears 10-13 days after vaccination. Since no trace of vaccinia virus was found in inoculated chick embryos, it is assumed that the presence of the virus in blood at the time of vaccination may have a delayed allergizing effect. The authors thank Dr. M. Stopnicka, Dr. Z. Bilinska, Dr. W. Pstragowska, and Dr. H. Karowska for making possible the research on the grounds of the Children and Infant's home.

Distr:  $4E2a(j)$

A long-life catalyst for the synthesis of acetone from ethyl alcohol. <sup>7</sup> St. Grzelczyk, I. Jarowska, Z. Kohman, J. Szajder, and E. Treszczanowicz. *Przemysl Chm.* 34, 28-33 (1955) (English summary).—A catalyst of an activity period of 500 hrs., consisting of  $Fe_2O_3$ ,  $Cr_2O_3$ , and  $CaCO_3$ - $CuO$  as activator, was prepd.; 54% (on wt.) of  $Fe_2O_3$ - $Cr_2O_3$  (as used for the conversion of  $CO$  and  $H_2O$  into  $CO_2$  and  $H_2$ ) obtained by the pptn., with  $AmOH$ , 38% of a pptd.  $CaCO_3$ , and 8% pptd.  $CuO$ , were thoroughly mixed, and pressed into pellets. This catalyst was tested in an app. described in detail. As reaction chamber an electrically heated pipe 60 mm. diam., vol.  $1/2$  l. was used.  $EtOH$  was supplied as vapor at a temp. of  $200^\circ$ . The reaction products (acetone,  $H_2O$ ,  $AcH$  0.6%, and  $AcOH$  0.02%) were condensed and the gases washed with  $H_2O$ . The feed was 840 ml.  $EtOH$  (20% by vol.)/l. catalyst/hr., temp. of the reaction  $400$ - $440^\circ$ . Although the best results (up to 95% yield) were obtained using 20%  $EtOH$  soln., it is advantageous to use a 30% soln. due to an increase of the amt. of produced acetone. The regeneration of the catalyst was accomplished every 500 hrs. by passing through it a mixt. of steam (1.5 kg./l. catalyst/hr.) and air (100-150 l./l. catalyst/hr.), and then air alone during 1 hr. Results on a semiindustrial scale. E. Treszczanowicz, A. Pilc, St. Grzelczyk, A. Szpyrkowicz, Z. Kohman, and J. Szajder. *Ibid.*, 28-33. <sup>10</sup> <sub>2</sub> <sup>1</sup> Many

results of lab. expts. were confirmed. The catalyst pellets used were 8 mm. diam., 6-8 mm. high. The temp. of the pipes contg. the catalyst was  $380$ - $420^\circ$ . The supply of alc. (20% by vol.)/l. catalyst/hr. was 750 ml. The regeneration of the catalyst was accomplished every 500 hrs. (temp.  $420^\circ$ ). The yield was 75-85%, exceeding from time to time 90%. L. G. Mantel <sup>11</sup>

Abstract: The utilization of dark honeycombs or of combs over 3 years old for the nest is not recommended. The honeycombs of the families that perished during the wintering period should be remelted. In order to disinfect the honeycombs, cotton pads soaked with 40% formalin or, still better, with glacial acetic acid, are placed in the hive for 7 days. The disinfection of the inner
