TITLE: Potentials of repulsive interaction between atoms of the inert gases

SOURCE: AN SSSR. Doklady, v. 165, no. 6, 1965, 1273-1274

TOPIC TAGS: inert gas, particle interaction, scattering cross section, atomic physics

ABSTRACT: The authors use data on the scattering of fast beams of neutral atoms for determining the constants K and ϵ in the formula $V(\gamma) = K/\gamma^8$ for repulsive interaction between heavy inert gases (Kr , Xe), as well as for combinations of these gases with the lighter members of the series. Formulas are given for determining the potentials of interaction for mixed gases. Comparison shows satisfactory agreement between experimental and theoretical data for all systems of gases. The energies of interaction coincide with an accuracy of 15-20% for all systems except

L 14075-66

ACC NR: AP6003241

Ne-Kr and Ar-Kr where coincidence is somewhat poorer. This is apparently due to the fact that an increase in the curvature of the potential s reduces accuracy in determining the value of the other parameter K since the latter is proportional to the experimentally determined value of the effective scattering cross section. A comparison of the potential curves for the Xe-Xe and Kr-Kr systems with experimental data shows a noticeable divergence for the first case and satisfactory agreement for the second. The authors are grateful to Professor O. B. Firsov for discussing the results. Orig. art. has: 1 table, 2 formulas.

TITLE:	A device for producing fast beams of atoms and molecules			
SOURCE:	Pribory i tekhnika eksperimenta, no. 2, 1966, 182-186			
TOPIC TAGS:	molecular beam, particle beam, magnetic analyzer, ion source, charge exchange, elastic scattering, particle interaction			
ABSTRACT: A device is described for analyzing interatomic forces in the interaction energy range of approximately one electron-volt by measuring scattering of high-energy (10^2 - 10^3 ev) neutral beams through small angles. A block diagram of the experimental set is shown in the figure. Positive ions from source 1 are accelerated and directed into the magnetic analyzer chamber. An ion beam of fixed mass and energy is filtered out by magnetic analyzer 2 and sent to charge-exchange chamber 3. The beam is collimated and ions are eliminated by deflecting condenser 4. The neutral beam then passes into scattering chamber 5 and the change in intensity due to passage through the target is registered by detector 6. The proposed installation is based on elastic scattering of fast beams of neutral particles in a gas for determining the potentials of interatomic and intermolecular interaction. The individual components of the in-

stallation are each discussed in detail. The device was used for studying elastic and inelastic scattering of neutral beams at interaction energies ranging from 0.1 to 100 ev. The proposed installation may also be used for studying scattering of metal and chemically unstable atoms. The authors are sincerely grateful to A. I. Shal'nikov for his interest in the work and useful advice and to L. P. Khavkin for consultation.

Title: How the Quality of Cheese was Improved at the Danilovskiy Plant

Original

Publication: Moloch. prom-st', 1956, No 3, 22-23

Abstract: To improve the quality of cheese the following measures were put into effect: cooling of the milk to +10° at the milk procurement installations, utilization of ripe milk, changes in the system of milk flow through the apparatus, reduction in time of whey removal from the cells, provision of additional salting reservoirs, changes in the system of brine cooling, preliminary cooling of the cheese for 16-18 hours, decrease in temperature fluctuations within the cooling chamber of the cheese cellar. As a result during 1955 there were produced 80% of high grade Kostromskiy cheese as compared with 46% produced in 1954.

TITLE: Investigation of the Working Process in Condensers by Means
of Hydraulic Simulation of the Tube Nests (Issledovaniye rabo-
chego protsessa v kondensatorakh metodom gidravlicheskogo
modelirovaniya trubnykh puchkov)

PERIODICAL: Tr. Vses. nauch. inzh.-tekhn. o-va sudostroyeniya, 1955,
Vol 6, Nr 3, pp 50-65

ABSTRACT: A report on the results of an experimental study of the motion
of the steam-air mixture in the inter-tube space of a condenser.
The investigation was performed by means of the method of a
gas-hydrodynamics analogy, i.e., by replacing the plane flow
of a gas with the flow of a liquid in an open channel (on the
strength of the kinematic equivalence of the two flows when the
corresponding relationships among their parameters are ful-
filled). In the flow of the steam-air mixture in a condenser the
quantity of steam decreases along the flow owing to its conden-
sation. This phenomenon, which can be simulated by means of
a discharge of the liquid into pipes (through suitably made

Card 1/2

124-57-1-716

Investigation of the Working Process in (cont.)

drain holes) has an exceedingly important significance for the model test, since the analogs of the basic parameters of the gas flow are expressed in terms of the free liquid surface level. Thus the problem is severely complicated, and the conditions to be simulated can be given only approximately on the basis of some preliminary calculation, the results of which are deduced in terms of the test data by means of successive approximation. The author remarks that satisfactory agreement is obtained after a second or third approximation.

Title : Automatic Water-Flow Level Gauge

Orig Pub : Sudostroyeniye, 1956,² No 6, 31-33

Abstract : The automatic level gauge that measures the elevation of a stream of water in hydraulic model test installations is based upon the principle of maintaining continuous contact between the point of measuring needle and the surface of the water. The electric part of the apparatus includes an electronic amplifier and a phase-sensitive thyratron rectifier which actuates a reversible motor. Operation of each unit of the hookup is considered and design data of the apparatus are given.

Influence of isotonic solutions of sugar on epithelia of amphibia. J. KAMNEY (Trans. Physiol. Inst., Leningrad, 1938, no. 127--128). Experiments on vital frogs show that the epithelial cells of the intestine and other organs do not change in isotonic solutions of mono- and disaccharides. Consequently the saline properties of the external solution bathing the epithelial cells may be substituted by undissociated sugar acids. Skeletal and smooth muscle, on the other hand, undergo reversible destructive changes.

The nature of paraprotic and paraneurotic changes in living matter. I. Changes in some functional and physicochemical properties of skeletal muscle exposed to various alternative salt solutions. J. Kamnev. *Bull. biol. med. exp. U. S. S. R.* 7, 158-160 (1950) (in English). --The immersion of *m. cut. rectoris* of frog in hypotonic Ringer soln. (75% isotonic Ringer soln. and 25% distd. H₂O) causes in 4-6 min. an abrupt decrease in the excitability of the muscle. Weak curare solns. have the same effect. On the 10-15th min. of exposure to the soln. another drop (primary) in muscle excitability is noted. Microscopic examn. shows the appearance of faint staining of the sarcoplasm, while a faint luminosity is observed in the dark field (gelation). The nuclei are colorless. After 20-30 min. a secondary drop in excitability occurs, and in a short time excitability is lost. A considerable increase in the intensity of sarcoplasm staining and the staining of nuclei was observed. During the development of paraneurosis (appearance of gelation and staining of nuclei) the skeletal muscle retains the capacity of conducting impulses. An isotonic soln. of KCl with 3 parts of Ringer soln. gave the same results except that muscle excitability was suppressed some time before the appearance of vital staining of the nuclei. Hypertonic solns. gave the same effect but without gelation, owing possibly to the peptizing action of the solns. which inhibits the colloidal changes in the muscle after denaturation of the substrate, and without vital staining, since the dye solns. are unstable in hypertonic media and ppt. out. These effects are observed when the muscle is transferred to isotonic soln. S. A. Kurjala

"Reaction of the Cornea to a Direct Current," I. Ye.
Kamnev, Dept of Gen Morph, Inst of Experimental Med,
Acad Med Sci USSR, Leningrad, 32 pp

"Zhur Obshch Biol" Vol X, No 2

Study of experimental material showed that a direct current caused definite reactive changes in the corneal tissues of both a macro- and microscopic nature. Concludes that definite regroupings of an ionic nature underlie an extensive class of periodic processes, from various periodic formations in gelatin to rhythmic processes in the nerve and tissues of the cornea.

Action of light on accumulation by cells and tissues of the roots of dyes and the deposition of the latter in the granules.
I. E. Khatnev and M. Kh. Zakiyan (V. M. Molotov State Univ., ROSTOV-on-Don). *Doklady Akad. Nauk S.S.R.* 104, 932-4 (1965).—Roots of millet immersed in soln. of neutral red (methylene blue was also used in a few cases) under different illumination levels produced the following effects. The older outer layers of the roots absorb dyes very rapidly; the cells of the sheath which are rich with plasma show the deposition of the dyes in granules which gradually fill the cell. In the central cylinder the dyes are concentrated in vacuoles. In young root-hair carrying tissues the dye is not formed into granules, but vacuoles of some cells are dyed. Illumination produces more intense coloring than is observed in the dark in living tissues, except for the very outer layers which are unaffected. Vital dyeing in the dark produces less granules than in illuminated state. Thus the roots are not indifferent to illumination. G. M. K.

of a frog; the formation rate of granules of
neutral red served as an indicator for the in-
tensity of intracellular processes. The de-
position of granules is intensified at a
temperature of above 20° as well as in 2 and 4
percent glucose solutions and 2-4 multiple
Ringer solutions. High (above 27°) and low
(0°) temperatures and high concentrations of
salts and glucose produce a retardation of the
granule formation. The most stable are those
which form at the beginning when the first
granules of the dye appear and the environ-
mental conditions undergo various changes. --

separate granules, while the protoplasm and the nucleus are not stained. In aged cells, the intensity of granule formation is reduced. In dead cells, no granules are formed, the protoplasm and nucleus stain diffusely. The second method, using microscopic cell observations against a dark ground, is based on the fact that in the absence of light, the nucleus and protoplasm of normal cells are invisible. If a cell is subjected to unfavorable conditions, a radiance is seen in the nuclear membrane and granules of protoplasm. Live staining may be used as a quick and safe method for

SOV/2166

Opyt ratsionalizatsii kuznechnogo proizvodstva; k 250-letiyu Leningrada
(Experience in Improving Forge Work; On the 250th Anniversary of Leningrad)
[Leningrad] Lenizdat, 1957. 194 p. 3,000 copies printed.

Ed. (Title page): P.V. Kamnev; Ed. (Inside book); Ye. V. Yemel'yanova;
Tech. Ed.: N.I. Rodchenko

PURPOSE: The collection of articles is intended for workers and engineers in
forge shops and also for designers of machinery in related branches of machine
manufacturing.

COVERAGE: The book describes the experience gained at several Leningrad plants
in the rationalization of manufacturing processes, modernization of equipment,
and improvement in the economics and planning of forging production. Tables
and drawings accompany every article. No personalities are mentioned. There
are no references.

TITLE: Primary Goals of the Press-forging Shops in Leningrad
(Osnovnyye zadachi kuznechno-shtampovochnykh tsekhov
leningradskikh zavodov)

PERIODICAL: V sb.: Kuznechno-shtampovochn. proiz-vo. Leningrad,
Lenizdat, 1957, pp 25-45

ABSTRACT: In the struggle for further technical progress the following
goals are pin-pointed: specialization and co-operation in the
production, organization of specialized shops, rationalization
of the press-forging production, and group training of workers.

Perevodoy optyt kovki (Advanced Experience in Forging) [Leningrad] Lenizdat, 1959. 246 p. 5,000 copies printed.

Ed.: Ye.V. Yemel'yanova; Tech. Ed.: I.M. Tikhonova.

PURPOSE: This collection of articles is intended for workers and engineers in die-forging shops and for personnel of affiliated branches in the machine industry.

COVERAGE: The articles deal with the advanced experience of a number of Leningrad plants in mechanizing and improving production methods in die forging. Recommendations are made concerning the specialization of forging shops, and the further development of open-die forging processes. Articles by operators-innovators in forging shops of the Novo-Kramatorskiy (New Kramatorsk) and Ural'skiy (Ural) machinery plants are included. The collection contains some of the papers which were discussed during the conference in June 1958 (P.V. Kamnev, Chairman) on open-die forging, called by the regional section for the pressworking of metals of the Leningradskoye Pravleniye nauchno-tehnicheskogo obshchestva mashinostroyitel'noy promyshlennosti (Leningrad

Ispol'zovaniye rezervov mashinostroitel'nogo proizvodstva; iz opyta peredovykh zavodov (Utilization of Reserves in the Machine Building Industry; Practices of Leading Plants) [Leningrad] Lenizdat, 1959. 258 p. 3,000 copies printed.

General Ed.: A.M. Kucher, Candidate of Technical Sciences; Ed.: M.S. Chervova.
Tech. Ed.: I.M. Tikhonova.

PURPOSE: This collection of articles is intended for workmen and technical personnel of the machine-building industry.

COVERAGE: The book examines principal trends in the utilization of unused production capacity of machine building plants and indicates ways to realize these reserves. On the basis of examples drawn from the practice of the leading plants of the Lensovnarkhoz, the authors show how to utilize this unused capacity by applying the following measures: improvement of the processability of constructions; bringing the shapes and sizes of blanks closer to the shapes and sizes of finished parts; replacement of mechanical machining with cold stamping; improvement of the efficiency of existing technological processes and introduction of new ones; and a comprehensive mechanization and automation of the equipment. The problem of utilizing unused capacity in the construction of heavy machinery is dealt with separately. No personalities are mentioned. There are no references.

TITLE:

The Group Method of Production of Forge Work (Grup-
povoy metod proizvodstva pokovok)

PERIODICAL:

Mashinostroitel', 1959, Nr 2, pp 8-13 (USSR)

ABSTRACT:

In this article, the author praises the success of the introduction of the group method of production achieved by the Mekhanicheskiy zavod (Mechanical Plant) of the Upravleniye tyazheloy promyshlennosti (Administration for Heavy Industry) of the Lensovnarkhoz. The plant installed five crankshafts presses with pressing force from 200 to 800 tons for forge works of up to 70 kg. The lag in introducing the group production method in other Leningrad plants is cited. The author describes some innovations introduced in other unidentified Leningrad plants. There are 12 sets of diagrams and two tables.

PURPOSE: This collection of articles is intended for technical personnel in machine plants, designing organizations, and scientific-research institutes. It may also be useful to skilled workers.

Card 1/7

Group-Processing (Cont.)

SOV/4754

COVERAGE: The collection consists of papers presented at the 1st All-Union Conference on Group Processing in the Machine and Instrument Industries, held November 24-28, 1959 in Leningrad. The conference was called by scientific and technical societies of the machine and instrument industry, GNTK RSFSR, and Lensovznarkhoz. The articles are based on the experience of industry in introducing the grouping principle in processing. They discuss basic trends in development, and group machining as the basis of mechanized continuous production. The designing of automatic production lines, construction of accessories, and modernization and specialization of equipment are discussed. Problems dealing with the introduction of group-machining methods into processing on various machine tools and into production of blanks (casting, pressworking, pressing of plastics) are considered. Planning, standardization, and methods for calculating the economic effectiveness of group processing are also treated. No personalities are mentioned. There are no references.

AUTHOR: Kamnev, P.V.

TITLE: A Seminar on the Group-Method of Forging Production

PERIODICAL: Kuznechno-shtampovochnoye prizvodstvo, 1960, No. 6, p. 48

TEXT: The seminar was the first on the "group-method" of forging production. It was convened on February 2 - 7, 1960, in Leningrad and had been organized by the Ural'skiy dom tekhniki (Ural House of Techniques), Leningradskiy dom nauchno-tehnicheskoy propagandy (Leningrad House of Scientific-Technical Propaganda), and the Sverdlovsk and Leningrad sections of metalworking by pressure of NTO Mashprom; 249 delegates from the Urals and from the Leningrad region participated. Reports were heard on the essence of the "group-method" (no details are given in the article), its prospective development and its role as the fundamental means for specialization of forging shops. Information on the use of this method was given in reports of Engineers S.N. Gil'denblat of Armaturnyy zavod (Fittings Works, Leningrad); Z.S. Bogdanova of Mekhanicheskiy zavod (Mechanical Works, Leningrad); Yu.I. Vits of "Elektrosila" works, Leningrad; V.P. Chikidovskiy of Metallichесkiy zavod (Metal Works, Leningrad); S.K. Kruchinin of

Izhevskiy metallurgicheskiy zavod (Izhevsk Metallurgic Works); V.M. Manayev of Uralmashzavod; A.M. Sychey of the Sverdlovsk Sovnarkhoz; A.I. Maksimov of the Gor'kiy Sovnarkhoz, et al. (No information on the contents of the reports is given). The participants were shown the practical use of the method directly at the Leningrad works; at the Fittings Works (mass production of forgings on crank presses, friction presses and horizontal forging machines); "Elektrosila" (mass and small-lot production with the use of stamping drop hammers and crank presses); Mechanical Works (combined forging and hot stamping on crank presses, small-lot production); Metal Works (forging on air-steam forging drop hammers and stamping on stamping drop hammers and friction presses). The drawings of the dies, attachments, other technologic documents and pamphlets published by the NTO Mashpram jointly with the Leningrad House of Scientific-Technical Propaganda were distributed. The seminar decisions included the following statements and recommendations: 1) The "group-method" is an effective means for radical improvement of production techniques; 2) The available first experience data must be used in the first line for piece, small-lot and mass forging production; 3) The method must be accepted as the foundation for specialization of forging shops. It was stated that the method a) gives forgings nearer to ready parts in shape and dimensions; b) reduces metal waste; c) permits special auxiliary equipment to be used in a wider

Card 2/3

A Seminar on the Group-Method of Forging Production

A161/A029

range of work; d) increases the production lots, which makes possible the utilization of mass production methods in small-lot production; e) extends the application range for principally new technology (pressing, extrusion, rolling, etc.); f) raises the equipment utilization coefficient; g) raises 2 - 3 times and more the work efficiency of worker teams; h) reduces the consumption of steam, fuel, metal for the forgings, die steel, and hence the production costs; i) improves the work conditions. It was decided that the organization of such seminars is necessary also in other economic regions of the USSR, and one more seminar for specialists of the Urals and Leningrad is advisable.

TITLE: A device for automatically choosing the selection angle in a short-wave communications system with spatial beam selection and relative phase keying

SOURCE: Vsesoyuznaya nauchnaya sessiya, posvyaschennaya Dnyu radio. 22d, 1966. Sektsiya teorii i tekhniki peredachi diskretnykh signalov. Doklady. Moscow, 1966, 32-36

TOPIC TAGS: phase coding, antenna radiation pattern, short wave propagation

ABSTRACT: The authors discuss the SW spatial selection system for separating reception signal beams with respect to angle of arrival by using an antenna with a controllable narrow radiation pattern in the vertical plane. Effective operation of a communications system with this type of selection requires a device which automatically selects the principal lobe of the radiation pattern in the position corresponding to the selection angle. A device of this type is proposed which is designed for operation of a radio channel in the relative phase keying system (any multiplicity). A block diagram of the device is given for the case where the antenna (cophased array) has two independent controllable lobes in the vertical plane, the working lobe and

an auxiliary lobe which continuously scans the range of possible angles for signal arrival. It is assumed that the scanning process is discrete, usually consisting of no more than ten steps. The operating principle of the automatic selection device is based on the fact that during operating on a single beam (when the ratio of the power of the selected beam to that of the remaining beams is high) with frequency doubling, keying modulation stops and the signal component corresponding to the doubled carrier frequency remains. During operation on two (or more) beams with a delay time greater than the length of the elementary pulse group, keying continues with frequency doubling and there are other signal components corresponding to the spectrum of phase-keyed oscillation in addition to that for the doubled carrier frequency. Consequently if there are facsimiles of the phase-keyed signal of identical amplitude for the cases of single- and multiple-beam radio channels, they may be differentiated by measuring the spectral density on the doubled carrier frequency (after the doubler). The higher spectral density corresponds to the single-beam radio channel. The device contains a limiter designed for balancing the amplitudes of oscillations received by the auxiliary lobe of the antenna in each of its positions and for eliminating spurious amplitude keying. A high-Q resonator tuned to the doubled frequency is used for accumulating the energy of the signal on this frequency during the period when the auxiliary lobe is in one of its positions. After passing through the detector, the rectified voltage is fed through a switch corresponding to the position of the auxiliary lobe for a given time interval to a memory unit (capacitor) which stores the magnitude of this voltage. After the voltage corresponding to the last position has

Card 2/3

L 46056-66

ACC NR: AT6022341

been stored, all voltages are compared. A control pulse is then sent from the capacitor with the maximum voltage to the control unit for the working lobe, and this lobe is set at the position corresponding to that of the auxiliary lobe where the maximum voltage was recorded. Calculations show that the time for filter integration should be at least 100 times greater than the duration of an elementary pulse group. For instance at an operating speed of 2,000 bauds, the band of the integrator filter should be 20 cps giving a scanning time of 0.5 sec for ten steps. The multibeam pattern remains constant through this time interval. The accuracy of adjustment of the system to the optimum beam may be increased by sending the command for fixing the working lobe of the radiation pattern after several scanning cycles. Orig. art. has 1 figure.

Problems in space radio communications (Voprosy kosmicheskoy radiosvyazi)

Moscow, Izd-vo "Sovetskoye radio", 64. 0312 p. illus., biblio. Errata slip inserted. 6,000 copies printed.

TOPIC TAGS: space communication, radio communication system, radio relay, artificial earth satellite, lunar communication, global communication, active communication satellite, passive communication satellite

PURPOSE AND COVERAGE: The book examines two principle aspects of space radio communication: the use of artificial earth satellites (and the Moon) for creating global and local systems of ground communication of a distinct type and the guarantee of two-way radio communication with Earth for space ships. It presents the general principles for constructing communication systems with relay through the artificial earth satellite and gives examples of global and local systems of ground communications. On the basis of an analysis of the values entering into the equation of active and passive communication, the book presents and evaluation of the optimum working frequencies and energy losses in active and passive relaying. It gives an energy calculation of space radio communication lines in the limits of the solar system. It also presents materials published on communication systems with space objectives launched by the U. S. S. R. and the U. S. A., and on systems of ground communication
