TITLE: Membranes based on styrene-formaldehyde resins. Part 2. A study of the structure of styrene-formaldehyde resins by infrared spectroscopy

SOURCE: AN KazSSR. Institut khimicheskikh nauk. Trudy, v. 11, 1964. Sintez i issledovaniye vysokomolekulyarnykh soyedineniy (Synthesis and research of high-molecular compounds), 104-107

TOPIC TAGS: styrene formaldehyde resin, polystyrene membrane, infrared spectroscopy, polymer composition, styrene polymerization

ABSTRACT: Styrene-formaldehyde resins were prepared by a method described in the first part of the paper (Izv. AN KazSSR, Seriya Khim. i Tekhn. Nauk (1963), #3), involving condensation in the presence of 45% sulfuric acid and when 0.5:1 to 3:1 molar ratios of formaldehyde to styrene; they were analyzed by infrared spectroscopy of the membranes or their solutions in carbon tetrachloride. The spectra shown in Fig. 1 of the Enclosure proved the absence of vinyl groups; thus, the reaction proceeds with the participation and

Card 1/3

L 21341-65

ACCESSION NR: AT5001011

elimination of double bonds in the styrene chain. Oxygen is bonded into ether and acetal groups, and the length of the acetal chain increases with the feed concentration of formaldehyde. Aromatic rings do not form a part of the linear chain, whose terminals are formed by hydroxyl and methyl groups. Ketone groups are present, but the low intensity of the corresponding bands indicates a low concentration. Selected structures for the chain of styrene formaldehyde resins are proposed. Elemental composition, molecular weight, specific gravity, and refractive index of the studied specimens were determined and tabulated. Orig. art. has: 2 tables, 1 figure, and 4 formulas.

Analysis of crude tall oil. V. D. Khudovekov and M. V. Kartseva. Zhur. Priklad. Khim. (J. Applied Chem.) 23, 428-31(1950).—Use of commonly applied methods for tall oil analysis without detn. of petr. ether insol. matter leads to erroneous interpretations, since the specimen may contain varying amts. of oxidized substances, The amt. of rosin acids in all specimens examd is variable and is always larger when the detn. is made by volumetric method without sepn. of petr. ether insolubles than when it is made gravimetrically. insolubles may range from 8.8 to 16.5%. Correspondingly, such volumetric method will give low fatty acid value, especially when rosin acid level is high. The sum of neutral bodies, petr.ether insolubles, and rosin and fatty acids is never 100 %. The petr. ether insolubles form, even after removal from the original sample, in the course of analysis (during sapon.) largely at the expense of the rosin acids. Hence, they are oxidation products of rosin acids. G.M. Kosolapoff

Method for increasing the yield of tall oil. V. D. Khudovskov and M. V. Kartseva. *Bumash. Prom.* 25, No. 2, 30-2 (1950).—An air-flotation method for the recovery of tall oil from sulfate black liquor (I) is described and a comparison of various methods of tall oil recovery is made. In degt. the tall oil in I, 60 cc. I is decompd. with 30% H₂SO₄ and the residue is filtered and washed with H₂O, dried, and extd. with toluene, the toluene is evapd., and the residue is extd. with Et₂O, and dried to const. wt. The petr. ether solv. of the Et₂O ext. is also detd. The Et₂O-sol. fraction of the samples of I tested ranged from 4.2 to 18.6 g./l., and the corresponding petr. ether-sol. fraction 3.2 to 15.4 g./l. Three methods of tall oil sepn. are studied: air flotation by treatment of the warm I with regulated flow of air, cooling the I from 75 to 40°, and letting the I stand 48 hrs. The total Et₂O-sol. fraction removed from the I by the 3 methods is 86.1-88.4, 48.9-36.0, and 72.8-42.4%, resp., and the total petr. ether fraction removed is 93.8-74.7, 81.5-57.7, and 73.8-51.1%, resp. The total petr. ether fraction of the I removed by the flotation method is independent of the original concn. in the I. In mill trials of the flotation method, the concn. of the Et₂O-sol. fraction is reduced from 18 to 10-11 g./l. for concd. I and from 5-6 to 2.5-2.8 g./l. for dil. I. The most favorable results obtained are a reduction of Et₂O-sol. fraction from 4.0 to 2-2.5 g./l. for I from the washers and from 8-10 to 3.5 g./l. for I from the evaporators, results which can be duplicated only by letting the I stand more than 100 hrs., and representing an increase in tall oil recovery of 15-20 kg./ton of pulp. The higher degree of tall oil removal facilitates evapn. of the I.

Colorimetric method for determining streptomycin. E. M. Savitskaya
and V. D. Kartseva (*J. anal. Chem., USSR*, 1953, 8, 46-49).—
Streptomycin in acid medium gives with 2 : 4-dinitrophenyl-
hydrazine a yellow hydrazone; the excess of the orange coloured
reagent is extracted with butyl acetate and the absorption of the
aq. solution containing the product of the reaction is measured at
4300 Å. by means of a differential photoelectric colorimeter. A
similar reaction is given by D-mannosido-streptomycin which
usually accompanies streptomycin. Otherwise the reaction is
specific for streptomycin in an unpurified preparation.

On hypo- and anoxia of the myocardium. IIId communicationl experiments with KCN Kliniche-skaya Meditsina 1947, 25/2 (35-40)

In previous experiments it was shown that hypoxia and anoxia of the myocardium had a most marked influence on the R wave. In various experiments on isolated animal hearts it was found by Konig and others that in anaerobic conditions (N or H atmosphere) the perfused heart may beat for some time without oxygen, for one hour and longer. The same experimental condition is realized by intoxication of the heart with KCN which in concentrations of 0.001 N does not interfere with dehydrogenase (Belitzer.). This explains why no immediate death of tissues follows this mode of intoxication. In experiments on dogs electrocardiograms were compared before and after the introduction of 70 mgm KCN into the circulation. Very definite changes occurred in the R and T waves, R becoming much lower and T higher.

This confirms the impression that the R wave is concerned with the oxygen-consuming chemical process of the metabolism of the heart and the T wave with the anaerobic processes. Low voltage of the R wave is seen in infection, anaemia, diffuse myocardial sclerosis, myxoedema, and all conditions where oxygen consumption of the heart muscle may be presumed to be low. High T waves were seen in stenocardia, in convalescence from typhoid fever, etc. This illustrates conditions where, as a result of serious damage to the heart muscle, anaerobic processes are intensified. In the normal E. C. G., R and T may express two phases of the metabolic process in the muscle, the former the aerobic and the latter the anaerobic phase.

TITLE: Experiments on the Stimulation of Cumulus Clouds in the
Alazani Valley (Opyty po vozdeystviyu na kuchevuyu oblastnost'
v Alazanskoy doline)

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geofizicheskaya,
1959, Nr 2, pp 262-275 (USSR)

ABSTRACT: The Alazani valley (Fig 1) is often affected by the hail
from the cumulus cloud developing over the Caucasus Mountains.
In an attempt to prevent the hail falling on the valley, ex-
periments on affecting the hail formations by means of artifi-
cial stimulation were carried out in 1956 by the Institute of
Applied Physics, Academy of Sciences, USSR, in conjunction with
the Institute of Geophysics of the Georgian SSR and the Faculty
of Physics of Leningrad University. A method of generating
silver iodide smoke from ground level was used because seeding
from aircraft proved to be too difficult in this mountainous
area (the circle in Fig 1). The smoke was produced from red
phosphorus which reached the cloud in 5 to 10 minutes. It
was found that the best results were obtained where the ratio
of silver iodide to phosphorus was 1:2. The amount of 2 kg
of silver iodide gave a full crystallization of 1 km² of cloud

Card 1/5

SOV/49-59-2-11/25

Experiments on the Stimulation of Cumulus Clouds in the Alazani Valley

at the temperatures -5 to -10°C. The effect of sunlight in these circumstances was found to be negligible. The weather conditions were forecast the evening before the day of the experiments. The air lift was checked by means of the pilot balloons each time the smoke was produced. The formation of the nucleus in the cumulus cloud was followed on the radar screen and at the same time it was filmed. The height of the cloud was measured with theodolites. The results are presented in the form of a Table on pp 264 and 265. The data given are (from left to right): date, experiment number, place of experiment, amount of reagent in kg, time and height of the isotherms 0° and 6°C, time and height of cloud top, zone number and time of nuclei formation, remarks on visual observations. The remarks are as follows:
Experiment Nr 1 - precipitation at 15.30 hours from the cloud spot where smoke entered - then cloud dispersed;
2 - cloud dispersed at 14.20 hours,
3 - no results observed.
4 - cloud subsided between 14 and 15 hours.

Card 2/5

SOV/49-59-2-11/25

Experiments on the Stimulation of Cumulus Clouds in the Alazani Valley

- 5 - cloud breaking and dispersing, formation of crystallic forms.
- 6 - cloud dispersed during first 30 minutes.
- 7 - no results observed.
- 8 - first raindrops from the affected spot at 13.40 hours followed by hail and rain at 14 hours.
- 9 - first raindrops from the affected spot, rain started 17.20 hours.
- 10 - cloud breaking at the affected spot.
- 11 - hail at 10.20 hours.
- 12 - weak rain at 13.45 hours, followed by cloud dispersing above place of experiment.
- 13 - a weak precipitation at 11.35 to 11.40 becoming intensive at 12.25 from affected spot.

The locations of the cloud nucleus for various dates are shown in Figs 2, 5, 7, 9 and 10. The photographs of the smoke from some experiments are shown in Figs 3, 4, 6, 8 and 11. The following conclusions were made, based on the experiments:

- 1) The success in some cases suggests the possibility of rain stimulation by seeding the silver iodide into cloud composed of super-cooled drops at certain weather conditions.

Card 3/5

SOV/49-59-2-11/25

Experiments on the Stimulation of Cumulus Clouds in the Alazani Valley

- 2) In order to ascertain the results, the analysis of the complex data of the physical conditions of the cloud (such as stratification of the atmosphere, the cloud energy, visual observation on cloud formation and precipitations, radar observation of nuclei, etc) should be made.
- 3) The characteristic feature of the formation of the artificial nuclei by means of smoke is their lower height (1.5 to 2 km) in comparison with the natural conditions.
- 4) As the smoking is not always practicable, some other methods of cloud stimulation should be investigated (from pilot balloons etc).
- 5) The vital moment of affecting the cloud is when it reaches the region of -5 to -10°C. However, because of the very high speed of hail formation (20 m/sec), that moment can be easily misjudged. Therefore, in order to prevent this, an investigation of a possibility of the air layer stimulation should be carried out.
- 6) The experiments on combustion with red phosphorus show that

Card 4/5

SOV/49-59-2-11/25

Experiments on the Stimulation of Cumulus Clouds in the Alazani Valley

a method of determination of the action of hydroscopic matter on a warm part of the cloud should be investigated.

7) It is important to obtain more data on the necessary amount of the active chemicals which can be applied for cloud stimulation. There are 11 figures, 1. table and 5 references; 1 of the references is Soviet and 4 are English.

TITLE: On freezing of water drops with silver iodide. 1

SOURCE: AN GruzSSR. Soobshcheniya. v. 36, no. 3, 1964, 555-559

TOPIC TAGS: meteorology, climatology, cloud, cloud crystallization, atmosphere

ABSTRACT: The results of experiments performed to study the freezing of water drops in the presence of suspensions of silver iodide, both with and without the presence of an electrical field, are presented. The silver chloride suspensions were prepared in a distilled water base in the proportion of 1 gram/liter. Drops of diameter 500-1000 μ microns containing AgI particles were fixed to a fine filament of diameter 20-25 μ and placed in a chamber 2100 cm³ in volume. Cooling within the chamber took place at a controlled rate of 1 degree/min. Very sensitive temperature measuring equipment was used in the experiments, as the beginning of phase transition to freezing is detected by a minute increase in temperature. Techniques of microphotography by reflected polarized light beams were used to record various events in the processes, and identification of different stages in the freezing process was in accordance with the methods proposed by N. V. Gliki, A. A. Felishev, N. M. Marchenko (Obrazovaniye monokristal'noy granuly l'da pri zamerzaniii

TOPIC TAGS: atmospheric cloud, cloud seeding, climate control, pyrotechnics

TRANSLATION: A method is proposed for the introduction of iceforming aerosol substances into overcooled clouds, by firing into them from an airplane using an automatic multibarrel mount firing special anti-hail cartridges. The cartridges pyrotechnic charge ignites at a proper point in the trajectory and causes a trace of active smoke to form. The firing device is a 24-barrel block, consisting of six 4-barrel units. The anti-hail cartridge is described, and a formula given for an effective pyrotechnic compound to be used in it. The above method of introducing reagents was used to affect the heavy cumulous clouds in the Alazansksaya valley, during the period 1958 to 1962. The tests gave positive results. Similar methods may be used for the introduc-

2425. Karibyan, G. N. The construction of an engineering theory of lateral impact (in Russian). *Trudi Instituta Akad. Nauk SSSR*, 5, 73-85, 1935; Ref. *Zh. Mat.*, no. 11, 1936, Rev. 7785.

The general system of calculation for lateral impact with consideration of local deformations is discussed, the problem being reduced to an integral equation of the Timoshenko type.

When local deformations are linearly related to the impacting force, the impact phenomenon may be regarded as the free oscillation of a system consisting of a beam and an elastically attached load. In this regard, the displacing impact force and internal energy factors may be represented as time functions in explicit form.

The relationships obtained are valid only during the first period of impact, while the impact force excess is zero.

For the case of complex bar frames it is recommended replacing the distributed mass by concentrated (point) masses, reducing the system to a form with plural degrees of freedom.

ABSTRACT: The recently published "Norms and Technical Data for Designing Concrete and Reinforced Concrete Constructions" (Ni TU 123-55), analyses in detail the publication "Building Norms and Regulations". Calculations of stresses of bent reinforced concrete structures are based on the theory developed by Prof. V. I. Murashev (in collaboration with Ya. M. Nemirovski) in TsNIPS. The effect of prolonged loading is given in NiTU. Theoretical formulae and examples of calculations are presented. Table gives border values of coefficient for a rectangular section. There are four Russian References.

TITLE: The role of separate normal components in the process of seismic oscillations of complex systems

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 2, 1962, 19, abstract 2A138 (Soobshch. AN GruzSSR, 25, no. 6, 1960, 723-730)

TEXT: For structures with many degrees of freedom the problem of determining seismic actions is solved by breaking down seismic oscillations according to their normal components; this enables the maximum values of the inertias to be ascertained for each of the oscillatory forms. Determination of the calculated values of seismic forces meets difficulties of a principle and a technical nature in view of the fact that spectral analysis does not yield information about the phases of normal oscillations and about the comparative role of each of the normal components. The analogy of the behavior of any normal coordinate and the corresponding linear

Card 1/2

The role of separate ...

S/169/62/000/002/020/072
D228/D301

oscillator is incomplete, since the dependence of the inertias of the normal components on the natural oscillation period is not expressed by the spectral curve of the cited accelerations. The non-correspondence is due to the disregarding of the oscillatory forms which determine the coefficients of resolution when the function is presented as a series for the normal components. It is concluded that the relative role of individual normal components depends on the properties of a structure. Therefore the number of oscillatory forms taken into account in the calculation should be established separately for each specific system. In the case of the slow convergence of the series, representing the resolution of the full maximum inertia for the oscillatory forms, the summation becomes difficult. In this instance it is expedient to give preference to another method, which considers the seismic forces for each of the oscillatory forms as an independently calculated case. TITLE: Seismic inertia distribution down a building

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 9, 1962, 21, abstract 9A135 (Tr.. Gruz. politekhn. in-t, no. 5 (76), 1961, 47-52)

TEXT: The author studies the distribution of seismic forces down a pivot, which is fastened at one end and has distributed masses. The distribution of seismic forces is compared according to the static theory, the USSR's standards (CH 2-57 (SN 8-57)), and the Californian building code. The static theory considers seismic forces as being uniformly distributed down a pivot; in the SN 8-57 standards and the Californian code seismic forces are taken as equal to zero at the pivot's base. While solving the problem mathematically by the method of Fourier for an arbitrary moment of time, a sufficient number of terms must be retained in the formula of expansion. The practice of considering just one term, i.e. of

TEXT: The general geologic structure of the Akhalkalak region and adjacent areas is exposed, and seismologic data are given for this territory. The epi- and hypocenters of earthquakes are determined from G. K. Tvaltvadze's hodographs. Comparison of seismologic and geologic data provides the basis for drawing the conclusion that there is no seismo-genetic connection between the Akhalkalak highlands and the Kazbek area. The foci of strong earthquakes are related to the boundaries of tectonic units (Artva-Somkhit block, Adzharo-Trialet fold-system, and the

Card 1/2

The question of the...

Georgian block). The seismo-geologic structure of the Akhalkalak highlands is related to the seismo-geology of Turtsiya. Their intensive seismicity is, in the opinion of the authors, caused by recent volcanic movements. As is known, the Akhalkalak highlands were a stable part of the crust throughout the Alpine orogenetic-cycle, whereas intensive tectonic movements took place in their adjacent areas. Towards the end of the Neogene the picture changed: intensive tectonic movements began--in consequence of which the dismemberment of the crystalline basement into small blocks took place--and tectonic fractures, to which the earthquake foci are also confined, were formed. The results obtained by abyssal seismic sounding and other geophysical methods will have great significance for the deeper study of the seismo-geologic structure of the Akhalkalak highlands. Karcivadze, L. N. On the behavior of an integral of Cauchy type near the ends of the path of integration. Akad. Nauk Gruzin. SSR. Trudy Mat. Inst. Razmadze 18, 256-263 (1951). (Russian. Georgian summary) The author studies the Cauchy integral

$$(1) \quad \Phi(z) = \frac{1}{2\pi i} \int_L \frac{\phi(t)}{t-z} dt$$

near an end point c of the open curve L . If (i) $\phi(t)$ is in H on every arc interior to L and if (ii) near c one has $\phi(t) = (t-c)^{-\alpha} \phi^*(t)$ ($0 \leq \Re(\alpha) < 1$), $\phi^*(t)$ being in H near c , c included, then, according to Muskhelishvili [Singular integral equations . . . , OGIZ, Moscow-Leningrad, 1946; these Rev. 8, 586] $(z-c)^\alpha \Phi(z)$ is bounded near $z=c$; here $(z-c)^\alpha$ is a suitable branch, single-valued in the plane, cut along L . The author investigates (1) when the condition (ii) is deleted. When L is smooth and ϕ is Lebesgue integrable over L , then $(z-c)^\alpha \Phi(z)$ is bounded near c outside any closed angular neighborhood of c , which contains a portion of L abutting on c . The situation generally becomes quite complicated. The modulus of $\Phi(z)$ may be made to increase arbitrarily fast when z tends to c , provided that the density of the integral (1) and the mode of approach to c are suitably chosen. W. J. Trjitzinsky (Urbana, Ill.).

AUTHOR: Kartsivadze, I. N.

TITLE: Functions presentable in the form of potentials

SOURCE: AN GruzSSR. Vychislitel'nyy tsentr. Trudy, v. 4, 1964, 19-28

TOPIC TAGS: three dimensional space function, Borel group function, nonnegative function, potential representation, Lebesgue integral

ABSTRACT: The author studies the presentability, in the form of a potential of positive mass, of the function $W(P)$ defined in a region of three-dimensional space. Throughout the paper, the potential of a certain distribution $\psi(e)$ ($e \in B$) is understood to consist of a Lebesgue integral over the generalized metric of the point function of Q , $1/r(P, Q)$; where $r(P, Q)$ is the Euclidean distance between the points P and Q of the three-dimensional region. By positive mass, the author denotes a certain finite metric, i.e., a finite, denumerably additive, non-negative function of the group defined over the class B of all Borel groups of the three-dimensional space. Any distribution constitutes a certain generalized metric, i.e., a certain finite, denumerably additive group function of arbitrary sign, defined over the Borel class of groups. The

The carbohydrate and detoxifying functions of the liver during treatment of tuberculosis with streptomycin and pask, R. E. Kartsivadze, Akad. Med. (U.S.S.R.) 31, No. 12, 12-13 (1955). Streptomycin and pask (a trade-name for a Soviet antibiotic) are not merely bacteriostats; they also influence favorably the metabolism, especially in early forms of TB. They also normalize the disturbed functions of the liver-formation of glycogen and hypouric acid. Streptomycin is much more effective and lasting than pask is, and therefore can be used in smaller doses, which are less toxic. A combination of both antibiotics was found to be very beneficial when applied in small doses. In advanced cases the carbohydrate and detoxifying functions deteriorate to such a degree that the damage becomes irreparable.

Among 210 cases of various forms of pulmonary tuberculosis there were some who had in addition infections of the larynx, the intestines, the peritoneum, and meningitis. When streptomycin and β -aminosalicylic acid [PAS] treatment showed no results, a treatment with PAS and tibions [I] was given, tibone in doses of 0.02-0.06 g. a day and PAS 8 g. a day, the whole treatment comprising 8-16 g. of I and 600-800 g. of PAS in the course of 3-4 months. Particularly good results were shown by I in comparatively recent laryngeal or enteric tuberculosis. In patients with fibrous-cavernous forms the treatment with I and PAS weakened the outbreaks. In recent infiltration processes in the lungs the effect of I and PAS was the same as of streptomycin and PAS. The combined treatment was more effective, when a transfusion was made of the emulsion of the erythrocytosis substance of blood at 100-150 ml. 3-4 times a week. (Krasian) E. L. PARKER

Zhur.* 8, 143 (1940).—The heat Q of immersion of starch (I), starch monacetate (II), and starch diacetate (III) in H_2O decreases as the original moisture content of the sample increases. Extrapolation of Q to zero shows that the amt. of H_2O which can be bound by I, II, and III is 31%, 25%, and 19%, resp., i.e., 1 mol. H_2O per free OH in the mol. Gelatinized starch (IV) dried at 105° has a smaller Q (28.0 instead of 28.5 cal./g. at about 10°) than dried I and can bind less H_2O . Temp. increase lowers Q ; above 80° Q of I and IV are identical. Gelatinizing increases the no. of exposed OH groups. This is shown by greater adsorption of PhNH₂, chrysophenine, and Congo red on IV compared with I. From viscosity measurements, the ratio, length:width of starch mol. decreases from sol. starch to II to III. J. J. Bikerman

Study of the structure of starch. II. Structure of different starch modifications. S. M. Lipatov, B. A. Kartsovnik, and M. S. Shul'man. *Kolloid. Zhur.* 12, 289-297 (1948); cf. *C.A.* 43, 8715f. Native potato starch (I), sol. potato starch (II), and potato starch dispersed in a colloid mill (III) were compared. The dielectric const. of 1% aq. solns. for various wave lengths λ were identical (78 for $\lambda = 80$, 82 for $\lambda = 300$ m., etc.) for I, II, and III (and also for glucose) showing that only OH groups (other than the whole mol. turn in the elec. field). The heats Q of soln. in H_2O were almost equal (25.0-27.5 cal./g.) for I, II, and III at 10°, but were 25.0 for III (dispersed for 20 hrs.) and 17.0 for I and II at 70°. The great temp. coeff. of Q shows that I and II dissolve to aggregates rather than to single molts. Amylopectin, converted into a sol. state by a colloid mill, had $Q = 25.7-25.8$ at 20° and 60°. The osmotic mol. wt. found by extrapolation to infinite diln. was 170,000, 80,000, and 70,000 for I, II, and III, resp. The Cu nos. were 7, 15.4, and 7, resp., while cooked and then dispersed starch had 10.8, dispersed amylopectin 3, dispersed amylose 25.2, and dextrin (IV) 160. Hence, rupture of I to form III does not involve O bridges. From the viscosities of dil. solns. the ratios a/b were calcd.; a and b are the sizes of the spheroids approximating the mol. From this ratio and the mol. wt. a and b were found to be 20 and 925 Å. for I, 20 and 475 Å. for II, 19 and 408 Å. for III, and 19 and 112 Å. for IV. Hence, III forms from I by cross-rupture of long aggregates. It was amorphous for x-rays. When a soln. of III was evapd. at 40° and the residue dried at 60°, the resulting starch was insol., but could be made sol. by another treatment in a colloid mill. Fractional pptn. of aq. III solns. by BuOH yielded amylopectin and amylose. J. J. Bikerman

TITLE: Polymerization of Acrylonitrile in the Presence of a Ziegler Catalyst

PERIODICAL: Vysokomolekulyarnyye soyedineniya, 1960, Vol. 2, No. 7,
p. 1122

TEXT: In the form of a letter to the editor, the authors report on their successful production of polyacrylonitrile on a Ziegler catalyst with a reduced sorption of the monomer on the catalyst by additions competing with the monomer. Acetonitrile was used as such addition. The experiments took place in the atmosphere of an inert gas at 20°C. For an example, the composition of the reaction mixture in one test was the following:
25 g of n-octane (solvent), 12 g of acrylonitrile, 0.05 g of acetonitrile, $TiCl_4$, and tributyl aluminum in a molar ratio of 1 : 1 as catalyst in an amount of 1% by weight of the reaction mixture. After 25 hours the polymer yield was 6%. The intrinsic viscosity of the polymer solution in dimethyl

TITLE: A method for obtaining polyoxyalkylene polyols. Class 39, No. 176405
[announced by Vladimir Scientific Research Institute for Synthetic Resins (Vladimirskiy nauchno-issledovatel'skiy institut sinteticheskikh smol)]

SOURCE: Byulleten' izobreteniij i tovarnykh znakov, no. 22, 1965, 59

TOPIC TAGS: polymer, polymerization, catalytic polymerization, quaternary amine, resin, catalyst, ammonium

ABSTRACT: This Author Certificate presents a method for obtaining polyoxyalkylene polyols by the polymerization of alkylene oxides in a medium of hydroxyl-containing compounds at a temperature of 50-80°C in the presence of quaternary ammonium base catalysts. To increase the molecular weight of the polymers, the alcoholate or the hydroxide of tetramethyl ammonium is used as the quaternary ammonium base catalyst.

Spectrographic investigation of yohimbine. M. KARSHULIN. *Arhiv Hem. Farm.* 3, 227-31 (231 German) (1931). — The absorption spectra of yohimbic acid and yohimbine were found by comparison to agree with the spectrum of indole, but not that of quinoline. Two products were isolated on dry distn. of yohimbine the compns of which were $C_11H_{11}N$, m. 41°, and C_11H_9OH , b. 100°, resp. The last substance seems to be identical with 7-methoxy-1,2,3,4-tetrahydroquinoline, whereas the solid substance, $C_11H_{11}N$, appears to be identical with methyldihydroindole. I. KÜCKER

Structure and synthesis of halloysite. M. Karabulin and V. Stuhlik (Yugoslavian Acad. Sci., Zagreb). *Kolloid Z.* 124, 169-70(1951). Halloysite was prep'd. by mixing a soln. of AlCl₃ and Al(NO₃)₃ with NaSiO₃ at a pH of 3, and seeding with natural halloysite. Two species of ppt's result: the first ppt. (I) forming is cryst. (X-ray pattern), and the second, more voluminous ppt. (II) is amorphous. Comparison of I with natural halloysite shows that the synthetic species contains an excess of about 2 to 3 moles of SiO₂, and that the synthetic species lacks the dehydration max. found by differential thermal analysis at 550° for the natural mineral. I and II result, on drying at 105°, in a structure similar to that of the natural mineral. The difference between I and the natural material is explained by the relation of the silicic acid mols. in the synthetic substance. R. N. R.
