Title : Methods of Sowing and Specimens of Corn in the Kuzbyshev Oblast.

Orig Pub : S. kh. Povolzhiya, 1956, No 5, 27-30

Abstract : In 1955 on a number of varietal testing plots and experimental stations a study was conducted on methods of band, wide-row and continuous sowing, in comparison with square, nest sowing (70 x 70 cm). The lowest yield of corn, in fodder units, was obtained by continuous sowings. The other methods gave almost equal amounts of fodder units per hectare. The results of testing the corn varieties showed that the highest yield of green mass was obtained from the southern late-ripening varieties (Krasnodarskaya 1/49, hybrid VIR-42 and others). In some cases they

AUTHOR: Karuzina M.I., Candidate of Economical Sciences, Dotsent.

TITLE: Connecting the Problems of Economy to Life (Svyazyvaya problema ekonomiki s zhizn'yu)

PERIODICAL: Vestnik Vyshey Shkoly, 1957, # 7, pp 24 - 28 (USSR)

ABSTRACT: The author reports on the work of the Chair of Political Economy at the Moscow Institute of Aviation, from the viewpoint that the political training of students has to be done not only outside teaching hours but also during lectures. The author then gives some examples of the educational activity of this institute and the work of its instructors: Dotsent M.S. Dragilev, who is demonstrating in his lectures the effect of Marxist economic laws on capitalist industry and the resultant ruin of the working classes in the USA, England and the other capitalist countries; Dotsent I.A. Vyazmin who is dealing in his lectures with problems of socialist industry, and the great educational experience shown by Dotsent M.M. Litvin. There are, however, some deficiencies due to the fact that the treatment of socialist industry has often a dogmatic character. He also criticizes the neglect in the education of the masses in the sense of communist consciousness.

ORIG. PUB. : Chem. zvesti, 1959, 13, No 3, 163-169

ABSTRACT : The synthesis of 1-methylpyrrolisidine derivatives was carried out, during which the stage of ring closure was effected under conditions approximating physiological ones. The realization of the synthesis appeared to verify Schöpf's hypothesis (Schöpf, G., Angew. Chemie, 1949, 61, 32) regarding the biogenesis of alkaloids from substances of the general formula $\text{CHO}(\text{CH}_2)_x\text{NH}(\text{CH}_2)_x\text{CHO}$; the correctness of this hypothesis

TITLE: On Increasing the Recovery of Pyridine Bases (Ob
uvelichenii vyrabotki piridinovykh osnovaniy)

PERIODICAL: Koks i Khimiya, 1958, Nr 2, pp 41 - 43 (USSR)

ABSTRACT: An investigation of the operation of the pyridine recovery plant on the Zaporozh'ye Coke Oven Works was carried out. Various operational practices were tried. As a result optimum operating conditions were established: temperature of the bath, 55 - 60 °C, acidity of mother liquor 5 - 7%, concentration of pyridine bases 8 - 11 g/litre. Under these conditions, an average output of pyridine bases of 7 kg per ton of sulphate was obtained. Continuous treatment of the mother liquor from the same saturator is permissible as no decrease in the concentration of bases in the mother liquor takes place. A high acidity of mother liquor (8%) is harmful as the absorption of pyridine bases is not improved while the quality of ammonium sulphate deteriorates. There are 5 tables.

TITLE: Random pulse sequence generator. Class 42, No. 168525

23
B

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 4, 1965, 84

TOPIC TAGS: pulse generator 25

ABSTRACT: This Author Certificate presents a random pulse sequence generator containing a noise generator, pulse shaper, and coincidence circuit. To extend the variation region of probability of pulse occurrence at the generator output and to control the probability, the generator contains a noise voltage limiter with an adjustable limiter threshold. The limiter output is connected through the pulse shaper to one input of the coincidence circuit (see Fig. 1 on the Enclosure). The coincidence circuit output is connected to a shaper-extender to exclude input pulses supplied through the shaper-extender to the other input of the coincidence circuit. Orig. art. has: 1 diagram.

AUTHOR: Karvelis, B., Designer-Constructor (Kaunas)

TITLE: BK-4 "Kaunas" Glider (Planer BK-4 "Kaunas")

PERIODICAL: Kryl'ya rodiny, 1958, Nr 7, p 16 (USSR)

ABSTRACT: The author describes his BK-4 single-seater record-setting wooden monoplane, built for soaring in ascending thermal currents. Its safety factor equals 9. The trapezoidal wing with rounded tips has a main spar and second auxiliary spar for the wing-center plane attachment and for the support of the ailerons. The main-spar fitting is connected with the wing-center plane by two tapered bolts. The fore part of the wing is covered with plywood .1 to 2 mm. thick which extends to the main spar. The ailerons, consisting of 2 parts, extend along the entire span of the wing and are attached by hinges. The aileron control consists of a system of cables, brackets and horns. Slots at the wing tips are permanent auxiliary wings; each wing has 10 slots and 2 air brakes made of 900 x 100 x 2.5-mm. aluminum alloy plates. These slots prevent stalling of the wing even at critical angles of attack.

Card 1/3

BK-4 "Kaunas" Glider

85-58-7-22/45

The "monocoque"-shaped fuselage consists of four longerons and formers covered by plywood 1.5 to 2 mm. thick. The aft end of the fuselage has a vertical fin. The elevator is placed in front of the rudder. The stabilizer is fixed to the fuselage by a small wing-center panel. The cockpit is made of organic glass. The instrument panel is equipped with 6 devices. The glider has 3 hooks: (1) for catapult starts; (2) for towing by plane and (3) for automobile-towed starts. All three hooks are controlled by one lever and operate simultaneously. On reaching angles that exceed 45° during automobile-towed starts, the hook opens automatically. The glider proved satisfactory in practice and Kaunas glider pilots made many successful flights in it. The author states he has already begun work on a new record-setting BK-5 glider which theoretically will give a lift-drag ratio not lower than 33. The following data is provided on the BK-4 glider: length - 6.55 m.; height - 0.97 m.; wing span - 14 m.; wing area - 13.2 m.²; empty weight - 190 kg.; flight weight - 290 kg.; aileron area - 2.9 m.²;

Card 2/3

-4 "Kaunas" Glider

85-58-7-22/45

stabilizer and elevator - 1.67 m.²; vertical fin and rudder - 0.87 m.²; wing mean cross-section area - 0.38 m.²; minimum speed - 50 km/hr.; lift-drag ratio - 26; minimum descent speed - 0.75 m./sec. There are 13 photographs and a large cutaway sketch on three pages of the insert following page 16 showing the various parts of the glider.

TITLE: The maximum principle in the theory of differential N-person games

SOURCE: AN SSSR: Izvestiya. Tekhnicheskaya kibernetika, no. 6, 1966, 13-16

TOPIC TAGS: maximum principle, game theory, algorithm, linear differential equation, economic organization

ABSTRACT: The necessary conditions of the optimality of strategies in a differential N-person fixed-time game are formulated on the basis of the maximum principle of Pontryagin et al. (Pontryagin, L. S.; et al. Matematicheskaya teoriya optimal'nykh protsessov. Fizmatgiz, 1961). The existence of a unique solution satisfying the maximum principle is proved for a N-person linear differential game. It is shown that the pertinent algorithm for finding optimal strategies solves simultaneously also the problem of synthesis, i. e. makes it possible to determine the optimal strategies as a function of the initial conditions of the differential N-person game. A game of this kind may be interpreted as the production process of N econo-

mic associations functioning within the framework of a certain system. The ultimate goal of each association is the maximization of some indicator of performance (e.g. profits) as determined with respect to a finite set of states of the overall system, in the presence of disjoint regions of permissible economic strategies of the associations. If all the associations but one adhere to their optimal economic strategies, only the indicator of performance of the association deviating from the optimum may decrease. Title : Investigation Methods of Glass Crystallization Developed at the Glass Factory of the Institute of Glass and Ceramic Industry

Orig Pub : Szklo i ceram., 1958, 9, No 3, 60-66

Abstract : Reviewed are two groups of methods that permit the determination of the ability of glass to crystallize: 1) methods that measure the rates and the number of centers of crystallization of various glass masses at a constant temperature, and 2) methods of measuring of the above mentioned effects for one or two types of glasses simultaneously but at different temperatures. To the second group belongs the relatively simple method that employs a horizontal furnace, in which a gradual temperature gradient is attained. In

TITLE: Synthesis of glass ceramics of increased hardness by the use of noble metals as nucleating agents in heterogeneous crystallization

SOURCE: Szkoło i ceramika, no. 7, 1963, 188-189

TOPIC TAGS: glass ceramics, pyroceram, aluminosilicate glass, lithium oxide, potassium oxides, sodium oxide, glass, softening point, hardness, microhardness, heat treatment, nucleation, crystallization, noble metals, platinum, silver, nucleating agent, agate substitute, steel substitute, gem substitute, production cost

ABSTRACT: The present work is a continuation of research on the development of glass ceramics with a higher softening point and hardness. A two-step heat treatment of the Li₂O-SiO₂-Na₂O-K₂O-Al₂O₃ system, with noble metals (Ag, Pt) [amounts not specified] as

27 27 27

Card 1/3

L 20281-63

ACCESSION NR: AP3007380

nucleating agents, is considered. The samples were first heated for 2 hr to the nucleation temperature and then held there for 0.5—60 hr. In the second step the temperature was increased to the crystallization temperature in 1 hr and maintained at this level for 0.5—10 hr. The samples were then cycled for about 12 hr. Dilatometric and microscopic studies of the sample showed a uniform, fine-grained structure and softening point about 400C higher than that of the noncrystalline glass. Thermal treatment resulted in maximum hardness (1113.5 kg/mm² as against 700 kg/mm² for the noncrystalline glass) for samples heated for 12 hr at the nucleation temperature and for 2 hr at the crystallization temperature. The noble metals studied were similar in behavior as nucleating agents, probably owing to the fact that they were present in colloidal form at temperatures below the softening point. Glass ceramics obtained by this process can be used as substitutes for agate, certain precious stones, and high-grade steels. The production cost is on the order of that for ruby glass. Orig. art. has: 3 figures.

"Treatment of Diabetes with biguanide derivatives."

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 1, 1 Jan 63, pp 4-9

Abstract: [Authors' English summary] *Glucophage* (dimethylbiguanide) was given to 25 patients (age 17-65) treated in the diabetic out-patient department. All the patients had to keep their diet, besides 15 of them were given insulin and 9 the sulphonylurea derivatives. Acute gastrointestinal troubles were noted in 3 cases. Good results, ie better compensation or smaller dose of insulin were achieved in 20 patients. In 10% of the cases *glucophage* was of no effect. The authors conclude that biguanide derivatives cannot be used instead of insulin. Given together with insulin especially in patients with labile diabetes or in patients with large doses of insulin, these preparations are helpful in achieving better compensation.

This article contains three tables and twenty-three references. Nineteen of the references are Polish.
