Mineral Fertilizers in Chernozem Soils

Orig Pub : Agrobiologiya, 1957, No 3, 16-22

Abstract : The effectiveness of organo-mineral mixtures was  
tested on agrilaceous chernozem in the Kirdovsk  
Experimental Agricultural Station in 1954-1956.  
A yield of 26.7 centners of winter wheat per  
hectare was obtained in 1955, a very favorable  
year; the addition of 20 tons of manure produced  
an additional yield of 6.2 centners per hectare;  
of 3 tons of humus--an additional 6.7 centners

TITLE: Leaf fluorescence of higher plants at room temperature B

SOURCE: Biofizika, v. 9, no. 4, 1964, 469-476

TOPIC TAGS: fluorescence spectrum, plant leaf, room temperature,  
long wave maximum intensity, short wave maximum intensity,  
reabsorption, chlorophyll dimer fluorescence

ABSTRACT: Literature sources indicate that in fluorescence spectra  
of higher plant leaves at room temperature, long wave maximum intensi-  
ties are considerably higher than short wave maximum intensities. The  
present study investigated the fluorescence spectra of different  
leaves at room temperature to determine whether higher long wave  
maximum intensities may be attributed to reabsorption or to superim-  
posed fluorescence of a dimer form of chlorophyll pigment. Fluores-  
cence spectra of various leaves were measured at room temperature with  
a UM-2 monochromator. A DRSh-250 mercury lamp was used as a light  
source and a FEU-22 photomultiplier served as a receiver. Fluores-  
cence was measured no earlier than 5 min after light exposure to  
Card 1/2

L 11468-65

ACCESSION NR: AP4042477

ensure relatively stable intensity values. Reabsorption and pigment effects on fluorescence spectra of leaves were investigated in further experiments. Findings confirm literature data that long wave maximum intensities ( $13,500 \text{ cm}^{-1}$ ) are considerably higher than short wave maximum intensities ( $14,600 \text{ cm}^{-1}$ ) for leaves at room temperature. The lower short wave maximum intensity appears to be related to possible superimposition of chlorophyll dimer fluorescence with long wave maximum at  $13,500 \text{ cm}^{-1}$  and not to reabsorption. The ratio between short wave maximum intensity and long wave maximum intensity for a plant at room temperature can apparently be used as an index to plant chlorophyll form relations. The chlorophyll dimer level is not proportional to the total chlorophyll level of a leaf and may depend on plant growing conditions. Orig. art. has: 6 figures.

TITLE: On the Problem of Transformer Steel Melting

PERIODICAL: Metallurg, 1960, No. 6, pp. 18-22

TEXT: Information is given on peculiarities in the technology of transformer steel melting at the "Dneprospetsstal'" Plant, the Kuznetskiy metallurgicheskiy kombinat (Kuznetsk Metallurgical Combine) and the Chelyabinsk metallurgicheskiy zavod (Chelyabinsk Metallurgical Plant). A special feature adapted by the Dneprospetsstal' plant is that a relatively high content of C and S is obtained in the molten charge (0.30-0.40 C and 0.030-0.035% S). The carbon is oxidized by the ore and then by gaseous oxygen. The reduction time depends on the sulfur obtained in the finished metal (not over 0.005%). After teeming the metal is subjected to vacuum treatment in the ladle. At the Kuznetsk plant the melting process is conducted in a highly organized manner. The necessary amount of ore and lime is added to the charge so that the oxidizing and the melting stage are combined. After repeated slag formation the pool is subjected to oxygen blast; during the blast the carbon content is reduced to

Card 1/2

On the Problem of Transformer Steel Melting

S/130/60/000/006/007/011

0.02-0.03%. Until 1960, oxidizing at the Chelyabinsk Metallurgical Plant was brought about with iron ore and subsequent elimination of carbon by blowing the pool with oxygen. Presently, the oxidation and the melting stage have been combined; simultaneously with the charge 2.5 t iron ore and 1.0 t lime are introduced. It was stated that the amount of rejects was relatively low at all the plants. The dependence of surface defects in slabs on the metal temperature in the ladle is given and shows that the minimum percentage of rejects is obtained at a temperature of 1570-1590°C. The content of impurities in metals produced by the enumerated plants is represented by graphs. The metal produced at the Chelyabinsk plant contained the highest amounts of carbon, sulfur, manganese and nickel. The metal from Dneprospetstal' contained the lowest amounts of carbon, sulfur and chromium (to 0.005%). The metal from the Kuznetsk Combine contained more carbon and about 40% of the melts contained 0.006-0.008% S. Thousandths of a per cent of Ti were revealed in all the metals. Data on the output of high-grade rolled sheets made of metal which was produced by the aforementioned plants do not indicate the advantages of one over the other technology, since an effect of the used technology on the output was not established. There are 2 sets of graphs and 3 tables.

TITLE: Effect of some processes during steel melting in a 100-ton arc furnace

SOURCE: Stal', no. 1, 1967, 44

TOPIC TAGS: ~~silicon~~ steel production, silicon steel, ~~technological~~ metal melting, arc furnace, steel manufacture process

ABSTRACT: A technological process of making silicon steel in an arc furnace has been developed by the Central Scientific Research Institute of Ferrous Metallurgy im. Bardin in cooperation with the Novolipetsk Metallurgical Plant. The process combines melt-down and oxidizing periods and eliminates ore addition after melting of charge. A water-cooled oxygen lance is used for metal blowing and electromagnetic stirring of melted metal. Nonmetallic impurities are removed by slag treatment while the metal is tapped into the ladle. Oxygen is blown into the bath for 10-15 min when the carbon content reaches 0.08-0.12%. The process decreases the refining period to 1 hr and reduces the oxygen content closer to the equilibrium state and the sulfur content to 0.003%. [AZ]

TITLE: Theory of the Vibration Spectra of Unsaturated Compounds  
(Teoriya kolebatel'nykh spektrov nepredel'nykh soyedineniy)

PERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1958,  
Vol 22, Nr 9, pp 1023 - 1025 (USSR)

ABSTRACT: On the basis of abundant experimental information on unsaturated compounds the authors tried to generalize the conclusions drawn from it in two directions. The determination of the characteristic frequencies of some structural groups with a double bond and the observation of the mutual influence of the structural elements. To solve these problems, normal oscillations and the constants of the potential energy were computed by means of the theory of the small vibrations of polyatomic molecules (Refs 1-2). Partial results of these computations have been published already before (Ref 3). The basic results of the present paper can be condensed

Theory of the Vibration Spectra of Unsaturated Compounds SOV/48-22-9-3/40

as follows: The substitution of the hydrogen atoms by alkyl radicals in ethylene leaves the field of the remaining ethylene groups as well as the field of the alkyl radicals almost unchanged. The geometrical distribution of the alkyl radicals with respect to the double bond plays an essential role with regard to the spectrum. The calculations show that in the case of two double bonds that are separated by at least two single bonds the former ones exert almost no influence on each other. On the basis of the computation of the oscillation frequency of cyclopentene the spectrum of the molecule combination dispersion was for the first time interpreted with success. The frequencies and the force constants of some bromine-, chlorine,- and fluorine-substituents of ethylene were computed theoretically. Because of comprehensive data on the spectra of the deutero-substituted molecules it was possible to carry out an exact computation of the force constants. The good agreement between the computed and the observed frequencies proves the correctness of the whole system of constants. Compared with the halogen

Card 2/4

Theory of the Vibration Spectra of Unsaturated Compounds S07/48-22-9-3/40

substituents of saturated hydrocarbons the stability of the C-Br-, C-Cl-, and C-F-bonds in unsaturated compounds is somewhat higher. For the first time

$\frac{\partial P_i}{\partial Q_j}$  was computed in the first approximation of the optical valence scheme. On this occasion  $\mu_{CH}$  and  $\mu'_{CH}$  had, as expected, the same values for the oscillations of all types of symmetry. Thus the calculation has shown that the optical valence scheme only in first approximation is applicable to the computation of the intensities in infrared spectra. There are 4 references, 3 of which are Soviet.

AUTHORS: Sverdlov, D.M., Klochkovskiy, Yu.V., Kukina, V.S.,  
and Mezhuyeva, T.D.

TITLE: Vibrational Spectra and Potential Energy Constants of  
Halogenated Ethylenes. I. Monochloroethylene,  
Monofluoroethylene, 1,1-dichloroethylene,  
1,1-dibromoethylene and their Deuterated Derivatives

PERIODICAL: Optika i spektroskopiya, 1960, Vol.9, No.6, pp 728-733

TEXT: Sverdlov, Klochkovskiy and Kukina (Ref.1) showed that  
the vibrational spectra of halogenated ethylenes can be calculated  
using the force constants of ethylene (Ref.2) and halogenated  
methanes (Ref.3). The present paper extends this work to  
calculation of normal vibrations and potential energy constants of  
monochloroethylene and  $\text{CH}_2=\text{CDCl}$ , 1,1-dichloroethylene,  
1,1-dibromoethylene and  $\text{CBr}_2=\text{OHD}$ ,  $\text{CBr}_2=\text{OD}_2$ , monofluoroethylene  
and its seven deuterated derivatives whose formulas are given in  
the middle of page 728. For the purpose of this calculation the  
authors used the force constants of ethylene and halogenated  
methanes, as well as the force constants of halogenated ethylenes  
reported in the earlier paper (Ref.1). The calculations were

AUTHOR: Gordash, Yu. T.; Eklyar, V. T.; Serov, V. A.; Klochok, I. B.

TITLE: Petroleum desalination by use of complex pentaerythritol esters and carboxylic acids as surface-active compounds

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 10, 1984, 37-40

TOPIC TAGS: petroleum desalination, surface active compound, pentaerythritol, complex ester, esterification, carboxylic acid, hydroxyl group

ABSTRACT: The use of non-ionogenic surface-active compounds for petroleum desalination is commonly known and the authors discuss the effect of pentaerythritol on the desalination ability of complex esters of multi-atom alcohols and carboxylic acids having the length of a straight carbon chain. Esterification of pentaerythritol by a double excess of carboxylic acid yielded complex acetic, propionic, butyric and other esters. Within the 3500 to 3700  $\text{cm}^{-1}$  range, the esters displayed a very weak absorption band which is characteristic of free hydroxyl

Card 1/2

4. 1206-65

ACCESSION NR: AP4047389

groups. These esters were tested as desalination agents of Ukrainian petroleums. The optimal concentration of the complex esters was found to lie within the 0.005 to 0.01% (by weight) range. Extending the carbon chain in acid to C<sub>4</sub> enhanced desalination but a further increase had an appreciably adverse effect. The study of the degree of substitution of free OH-groups in pentaerythritic acid showed that an increase in the number of free OH groups in complex ester impedes the desalination of petroleum. Mixtures of pentaerythritol tri- and tetraesters with butyric acid gave the best results. The findings of the authors reflect the need for the development of more effective deemulsifiers to desalinate petroleums in any Soviet deposit. Orig. art. has: 2 figures and 2 tables.

TITLE: Thermic characteristics of 400-ton open hearth furnaces heated with cold  
gas and their influence on furnace productivity

SOURCE: Metalurgia, no. 1, 1966, 1-5

TOPIC TAGS: metallurgic furnace, metal heat treatment

ABSTRACT: The author describes several measures to improve the technical-economic performance of 400-ton open-hearth furnaces. Among the measures resulting in better combustion are the ensuring of adequate amounts of flames during the different charge periods and the provision of increased amounts of superheated steam to obtain the best possible mixture of the fuels. Title : The Agrotechny of the Sugar Beet.

Orig pub : Gaz. cukrown., 1957, 59, No 2, 53-54.

Abstract : The yielding capacity of beets in Poland is lower than in many other lands. Local conditions do not permit the methods of beet growing applied in USSR, to be applied everywhere in Poland. This relates to the method of placing fertilizer and to pocket planting. The best results under Polish conditions were obtained by an increase in the density of sowing. -- S.M. Tarshina

*Handwritten notes:*

The Use of X-ray in the Foundry. H. Lewis and J. Abre. (Metallurgist Library, 1951, 6, Sept., 129-132). (In touch).

The quality of steel castings is influenced by the accumulation of metal at junctions, particularly at those of the T-type. X-ray inspection of trial castings for mass production is therefore recommended. Several X-ray pictures showing faults at T-joints are shown and discussed. --P. P.
