Korovikov, V.

TITLE:

Participation of Scientists in Fulfilling the Decisions of the
XXI Congress of the CPSS (Uchastiye uchenykh v vypolnenii
resheniy XXI s"yezda KPSS)

PERIODICAL:

Atomnaya energiya, 1959, Vol 7, Nr 1, p 76 (USSR)

ABSTRACT:

From March 26-28, 1958 the annual general meeting of scientists of the AS USSR was held at the House of Scientists in Moscow. Vice-president of the AS USSR, A. V. Topchiyev, gave a report on the activities of the past year and on the tasks to be fulfilled in the future. President of the AS, A. N. Nesmeyanov spoke about Soviet research work carried out in the Cosmos by means of rockets and artificial sputniks. More than 20 persons took part in the general debate. Controlled thermonuclear reaction and the investigation of elementary particles were described as the most urgent problems of modern science. The Physico-mathematical Department was and still is the largest department of the AS. In the course of the last 3 years, 11 new institutes, 5 of which in Siberia alone, began to operate. Academician M. A. Lavrent'yev stressed the fact that at present, completion of the building of the Institut yadernoy fiziki (Institute of Nuclear Physics) is being accelerated. Corresponding Member

Decisions of the XXI Congress of the CPSS

SOV/89..7-1-17/26

of the AS USSR, B. P. Konstantinov gave a detailed account of the work carried out at the Fiziko-tehnicheskiy institut (Physico-technical Institute), the oldest Soviet center of nuclear science. At this institute, investigations of thermonuclear processes as well as of atomic nuclei are being carried out with particular thoroughness. A number of devices, such as a high-precision- β -spectrometer, are being newly built. The conference accepted the new statutes of the AS USSR, which were issued especially with a view of intensifying the collective carrying out of all future scientific work. In particular, all scientific work of the AS is to be better organized and coordinated, and the available means and laboratories are to be utilized and employed more advantageously.

cultures pass well through the vernalization stage in spring planting if the cooled zone embraces not only the roots but also the points of stem growth. The continuous cooling of the roots starting with the germination phase leads to a great retardation in the passing of the spring wheat through the light stage (the duration of the phase, - the third leaf - shooting, is almost doubled). The retardation in the development in the presence of lowered temperatures of the nutritional elements in the presence of lowered temperatures of the nutritional elements in the soil is explained by slower uptake and by the effect of the continuous cooling of the root system. The nodal roots are more sensitive to lowered temperatures than the embryo roots. They grow slower, thicker, branch out weakly, and are arranged almost horizontally. The content of ash elements and of N also increased with cooling as did the sugar content, especially

AUTHOR: Korovin, A. I.

20-6-41/48

TITLE: On the Influence Exerted by Low Soil Temperatures Upon the Efficiency of Certain Kinds and Doses of Mineral Fertilizers (O vliyanii ponizhennoy temperatury pochvy na effektivnost' nekotorykh form i doz mineral'nykh udobreniy).

PERIODICAL: Doklady AN SSSR, 1957, Vol. 115, Nr 6, pp. 1202-1205 (USSR)

ABSTRACT: Short summers with a general lack of heat, lower soil temperatures, especially at the beginning and towards the end of the time of vegetation, are peculiarities of the north. In the course of his studies on the influence of such soil temperatures on the crop of cereal, the author determined a distinct dependence of the effectiveness of some kinds and doses of fertilizer on the soil temperature. The tests were performed in Kareliya and Solikamsk in greenhouses. The low soil temperatures (6-7°C) were created by flowing spring-water into which the flower pots were placed. At first the author observed a prolongation of the

CARD 1/5

On the Influence Exerted by Low Soil Temperatures
Upon the Efficiency of Certain Kinds and Doses of
Mineral Fertilizers

20-6-41/48 1

vegetation period as well as a decrease in the crop of wheat, barley and oats due to lower soil temperatures which prevailed occasionally or during the entire vegetation period. The share of grain is reduced in favor of the share of roots. Field tests yield the same results: in years with cool summers the crop markedly decreases (several years test). This influence manifests itself according to the kinds and doses of fertilizer applied. At lower soil temperatures plants thrive better on ammonia-nitrogen, at higher temperatures on nitrate-nitrogen. Without a cooling of the soil the crop in 1955 was equal on both kinds of nitrogen. The advantage of ammonia manifests itself especially distinctly in the period of the reed-formation of the cereal on cooled soil. Later on the influence is weakened, whereas the effectiveness of the nitrate fertilizer increases. The structure of the vegetation period is also influenced by this: on cooled soil the time from seed to the formation of ears on ammonium is shortened, whereas on nitrate-nitrogen this holds for the time

CARD 2/5

On the Influence Exerted by Low Soil Temperatures
Upon the Efficiency of Certain Kinds and Doses of
Mineral Fertilizers

20-6-41/48

from the formation buds to ripeness. Differences up to one week occur. The unequal influence of the two N-forms at different periods of the plant-ontogenesis, according to temperature, upon the adaptation of the plants is apparently due to the fact that at the beginning of their lives they assimilate ammonium^N better (since these N-forms are in spring prevalent in the soil) and then, in the course of time, gradually go over to nitrate forms. The cooling of soil intensifies these peculiarity. Starting from this, the author added nitrogen to the soil in two portions: one half in the form of ammonium before sowing, the other half as top-dressing in the form of nitrate after the seed had come forth. This brought about good results three years in a row. The results obtained by Dadykin (1952) according to which nitrogen is worst assimilated from cool soil were completely confirmed. This holds true for phosphorus, too. The doubling of the N-doses at a soil temperature of 6-7°C acts negatively.

CARD 3/5

On the Influence Exerted by Low Soil Temperatures
Upon the Efficiency of Certain Kinds and Doses of
Mineral Fertilizers

20-6-41/48

The increase in the dose of phosphorus is not only of advantage in the assimilation of phosphorus itself, but also in that of N and K. At soil temperatures above 0°C the best results were attained with a combination of N: P: K = 1 : 3 : 1,5. This relation is called "northern" by the author. The stronger the negative influences of the north manifest themselves, the better is the effectiveness of this ratio of fertilizer: It increase with a decrease in soil temperature, inversely. In all tests made by the author the vegetation period was shortened by 5-10 days and the portion of rye in the crop increased. The action of the mineral fertilizer (especially of the "northern" dose) intensified, when it was brought together with stable manure. The action of stable manure alone is, at low soil temperatures, almost equal to zero. When the "northern" dose is brought in under two forms of N and separately,

CARD 4/5

On the Influence Exerted by Low Soil Temperatures
Upon the Efficiency of Certain Kinds and Doses of
Mineral Fertilizers

20-6-41/48

its effectiveness increases. Of special importance
is the shortening of the vegetation period which
was attained.

Title : Method for the Study of the Influence of Decreased Soil
Temperature on Plants.

Orig Pub : Fiziol. rasteniy, 1958, 5, № 1, 88-91.

Abstract : Spring water (plus 6°) was used to chill containers with plants; it was conveyed by pipes into wooden thick-walled vats. The containers standing in the vats were made of galvanized iron and chilled to different temperatures (plus 6° and higher) by means of varying the rate of movement of the water in the pipes. To study the ability of the plants to assimilate elements of mineral nutrition at decreased temperatures, container-riders were used which consist of two containers which connect in the upper part; one half of the container, which sits on the

New Processes in Hydraulic Machine Building (Cont.) Call Nr: AF 1129927

PURPOSE: This collection of articles is intended for engineers, technicians, innovators in hydraulic machine production methods and allied fields.

COVERAGE: This material deals with the work carried out by the technological department of the VIGM (All-Union Institute of Hydromachinery) on improvements in the technology of hydraulic machinery. Casting of hydraulic machine parts by the investment process (lost wax) and methods of casting in shell molds are discussed and illustrated. Processes of casting machine parts from high-strength magnesium-containing cast iron are demonstrated and explained. Methods on gaging vanes of axial-flow hydraulic machinery are illustrated and tables of standardized quality requirements for machines are included. The collection contains Russian contributions. No personalities are given. There are 7 bibliographic references, all of which are Slavic.

TITLE: Design of thin-walled drums of belt conveyors

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Mashinostroyeniye, no. 8, 1960, 139 - 147

TEXT: The author considers the possibility of reducing the wall thickness of drums (e.g. by replacing cast iron by steel), analyzes the stability of the drum and the possibility of use of hollow shafts, and compares several constructions of thin-walled welded drums with the usual cast iron type. Costs of production are discussed. There are 10 figures, 1 table and 2 Soviet-bloc references.
