Title : Square-Pocket Method of Cultivating Potatoes.

Orig Pub: S. kh. Sibiri, 1957, № 4, 47-50.

Abstract: At the Siberian Scientific-Research Institute of Agriculture the square-pocket method of cultivating potatoes was studied in 1952-1954 with a distribution of 70 x 70 and 60 x 60 cm and planting with one and two tubers. Highest harvests of potato were obtained from one tuber planting the 60 x 60 cm square. A positive effect of organic-mineral mixtures was obtained on the early maturing "Severyanin" variety; this was not observed with the "Berlikhingen" variety. -- V. S. Sal'nikov.

TOPIC TAGS: ion exchange resin, ion exchange membrane, polyethylene, grafted copolymer, polyethylene copolymer, polystyrene copolymer, divinylbenzene copolymer, polymer film, vinylphosphinic acid copolymer

ABSTRACT: A product with up to 75% polystyrene was obtained by the method of styrene-to-polyethylene copolymerization in the presence of peroxide or hydroperoxide initiators, used in the synthesis of homogeneous polyethylene membranes. The three stages of the process — swelling of the polyethylene in the styrene monomer, polymerization of the styrene in the film, and sulfurization — were investigated with respect to temperature and duration, and the physico-mechanical characteristics of the films were examined. To

enhance the mechanical properties and thermal resistance, 3% divinylbenzene was added to the reactants. By sulfurizing, phosphorylating or chloromethylating with subsequent substitution of amino radicals in the grafted polyethylene film, cation and anion exchange membranes were prepared with good physical-chemical properties, low electrical resistance and high selectivity. In separate studies, the feasibility of grafting polymerization of the di- β , β' -chloroethyl ester of vinylphosphinic acid to a polyethylene film (10 hrs. at 55°C followed by saponification) was established. TOPIC TAGS: polyethylene copolymer, grafted copolymer, sulfonation, phosphorylation, chloromethylation, amination, ion exchange resin, polymer conductivity

ABSTRACT: The graft copolymerization of styrene onto polyethylene film was accomplished in the presence of peroxides and hydroperoxides, the amount of grafted polystyrene attaining 75% of the film weight. The properties of the ion exchange membranes obtained by sulfonation, phosphorylation or chloromethylation with subsequent amination of the grafted polyethylene are shown in Table 1 of the Enclosure. A study was also made of the graft copolymerization of the α,β -dichloroethyl ester of vinylphosphinic acid onto the polyethylene film. After saponification of the ester groups, the grafted film acquired electrical conductivity. Orig. art. has: 5 figures and 6 tables.

TITLE: Phosphorylation of the grafted copolymer of polypropylene and polystyrene

SOURCE: Vy*sokomolekulyarnye soyedineniya, v. 6, no. 7, 1964, 1327-1329

TOPIC TAGS: grafting, grafted copolymer, ion exchange membrane, phosphorylation, polystyrene, polypropylene, polypropylene polystyrene copolymer, polymer film, polymer electrical property, phosphorus trichloride

ABSTRACT: Preliminary studies showed that ion-exchange membranes can be obtained by grafting polystyrene on polypropylene and the subsequent phosphorylation of the polystyrene side-chains. The mechanism of grafted copolymerization was then studied in the presence of initiators such as benzoyl peroxide in order to establish the optimal reaction conditions for obtaining a more uniform distribution of grafted polystyrene chains in the film. Grafting was carried out at the site of tertiary carbon atoms. The best polymer for grafting was found to be polypropylene, with an initial film thickness of $90-95\mu$, specific gravity = 0.90, $M_b = 3.1$, tensile strength = 350 kg/cm^2 , elongation at break 390%, and melting point 164-168°C.

ACCESSION NR: AP4042193

The reaction conditions are described. Tabulated data concerning the correlation between the degree of phosphorylation and the reaction time show that the best results were obtained by phosphorylation with PCl_3 and AlCl_3 for 12 hours at 65°C. The electrochemical properties of the ion-exchange membranes formed were improved by oxidation of the phosphinous acid groups to phosphinic acid groups. Ion-exchange films subjected to oxidation had not only a higher acid number but also a lower electrical resistance. The best electrochemical properties were shown by membranes containing 5% phosphorus. Orig. art. has: 2 tables and 1 chemical equation.

TITLE: Synthesis of phosphorus-containing homogeneous cation-exchange membranes on the basis of a polyethylene-polystyrene graft copolymer

SOURCE: Vy'sokomolekulyarnye soyedineniya, v. 6, no. 11, 1964, 2073-2077

TOPIC TAGS: graft polymer, polyethylene, polystyrene, cation exchange resin, polymer phosphorylation, surface resistance, exchange resin selectivity, tensile strength, ion exchange film

ABSTRACT: Turbidimetric, infrared and physicomechanical studies on the products of the grafting of polystyrene onto polyethylene showed that the major product (80-90%) is the graft copolymer. The composition of the graft copolymer obtained by extraction is tabulated. The polymer was subjected to turbidimetric titration on the FEK-M colorimeter. The polymer was precipitated with butanol from benzene solutions at a concentration of 0.005 g% For the graft films, the infrared absorption spectra showed bands in the region of 550 cm^{-1} characteristic for benzene rings. The intensity of the bands was proportional to the amount of grafted polystyrene. The relationship between the optical density and the amount of grafted polystyrene is plotted. The addition of 1-3% divinyl benzene (DVB) to styrene

card 1/3

L 16321-65

ACCESSION NR: AP4049159

eliminates the formation of small blisters on the film surface; increases the tensile strength and reduces the reaction time. An increase in the DVB content to 5% and more decreases the effectiveness of grafting, while 1% DVB eliminates the roughness of the film, but affects the reaction time very slightly. Grafting conditions were: 200 μ thick polyethylene film, immersed in a solution of DVB in styrene, containing 2% benzoyl peroxide, at 65°C for 4-5 hours. The optimum amount of grafted component is 30-35% by weight of the initial sample. A further increase in the degree of grafting causes the mechanical strength of the film to decrease. Cation exchange films were obtained by phosphorylation with phosphorus trichloride in the presence of the Friedel-Craft catalyst. The effect of the nature of the catalyst, reaction time and catalyst concentration on phosphorylation was investigated. Phosphorylation was complete in 6-10 hours. This reaction was also studied with other catalysts, which were soluble in phosphorus trichloride or in any other solvent. The experimental data are tabulated. The most active catalyst (in an amount of 2.5 moles per mole polystyrene) was AlBr₃ dissolved in a mixture of benzene and phosphorus trichloride at a volume ratio of 1:3. The membranes obtained by phosphorylation of the polyethylene-polystyrene graft copolymer have excellent electrochemical and physico-mechanical properties (such as a tensile strength of 150 kg/cm², elongation at break 32%, exchange capacity of 2.5 meq/g, surface resistance in 0.1 N NaCl of 1.5 ohm/cm², selectivity = 0.98) and can be used in different electrochemical processes. Orig. art. has 3 tables and 6 figures.

TITLE: Method for obtaining grafted copolymers. Class 39, No. 173407

SOURCE: Byulleten' izobretений i tovarnykh znakov, no. 15, 1965, 80-81

TOPIC TAGS: graft copolymer, copolymerization, fire resistant material

ABSTRACT: This Author Certificate presents a method for obtaining grafted copolymers by copolymerization of vinyl monomers with polymers or copolymers of α -olefin in bulk at high temperatures in the presence of peroxide or azo-initiators. To obtain fire resistant copolymers having ion exchange properties, the process of copolymerization is carried out in the presence of α -phenylvinylphosphinic acid.

Reduced at molybdate and tungstate ions on platinum microelectrode. This work was submitted for examination. O. A. Sonina, V. Z. Kotyarskaya, and A. P. Volkovskiy. Izv. Akad. Nauk SSSR, Ser. Khim., No. 10, 1955, p. 2211. Article 77-52 (in Russian). Titration of MoO_4^{2-} and WO_4^{2-} with AgNO_3 with Pt microelectrode as Ag^+ indicator was not possible because Ag^+ catalyzed the reduction of MoO_4^{2-} and WO_4^{2-} , so that already at low applied potentials mixed $\text{Ag}-\text{Mo}$ and $\text{Ag}-\text{W}$ deposits formed on Pt. Au. and to smaller extent Cu ions showed similar effects. MoO_4^{2-} and WO_4^{2-} shifted potential of Ag electrodes in neg. direction by 40 mV. and of Cu by 4-8 mV. Addition of FeCl_3 , NiCl_2 , and MnSO_4 to solns. of MoO_4^{2-} and WO_4^{2-} produced no deposits on Pt and no effects described above, although mixed electrodeposition of Mo and W with Fe and Ni has been reported. Titration of MoO_4^{2-} and WO_4^{2-} with Hg^{2+} and I⁻ microelectrode proceeded normally. Andrew Dravileks

"Why Readings of the Radio Altimeter RV-2 are Distorted in Certain Cases," by D. Kotlyarskiy, Senior Engineer, Complex Transport Expedition of the Academy of Sciences USSR, Grazhdanskaya Aviatsiya, No 4, Apr 56, pp 34-35

Explanation of the phenomenon of the discrepancy between radio altimeter readings and actual altitudes, is given in answer to an inquiry by Pilot P. Revelyuk of Krasnoyarsk, who, while engaged in low altitude (40 m) aerogeophysical surveys of the region, observed sharp drops in altimeter readings (from 40m to 28-30m) at the instant of change of terrain from dense woods to a lake surface, and reverse readings when backtracking on the same course.

Subject : USSR/Aeronautics AID - F-42
Card : 1/1
Authors : Yerokhin, A., Lt. Col., and Kotlyarskiy, M., First Lt.
Title : Execution of the Calculation of Instrument Landing by
the "Large Box" Method (Four turn method)
Periodical : Vest. vozd. flota 3, 28 - 36, March 1954
Abstract : The author defines the "Large Box" as a figure flown
in order to reach exactly the calculated point of the
beginning of the fourth turn before an instrument
landing. An example of an incorrectly executed "Large
Box" is given, and then the method of the correct
execution is explained in detail. Six diagrams, two
tables.

 TITLE The Estimation of the Upper Limit of the Cross Section of the
 Radiation Capture of Neutrons with the Resonance Energy (275 keV)
 by the Isotope Li.
 PERIODICAL Dokl. Akad. Nauk, 111, fasc. 2, 331-333 (1956)
 Issued: 1 / 1957

The authors used the continuous registration of β -decay acts of Li⁸ when irradiating lithium with neutrons. On this occasion the momenta caused by the α -particles of Be⁸ decay are separated from momenta caused by the products of the reaction of Li⁶(n,t)He⁴. The α -decay of the Be⁸ even occurs in the ground state within $\sim 10^{-16}$ sec, so that, from the experimental point of view, this process may be considered as simultaneous with the β -decay of Li⁸. The measuring device consisted of two gas counters. The inner counter (of usual construction) operates as a proportionality counter, its walls are covered with a thin layer of lithium fluoride with a content of natural isotopes. The exterior counter registers the electrons of the β -decay of Li⁸ and operates as a GEIGER counter; its construction is illustrated by a drawing. On these conditions the efficiency of the registration of the β -decay of Li⁸ (with respect to the registration of Li⁶(n,t)He⁴) depends only on the absolute efficiency of the counting of the electrons of the β -decay of Li⁸ by the exterior counter. The efficiency of the exterior counter attains 50 \pm 10%. Thus, the number of β -decay acts of

 SUBJECT Effect of humic fertilizers on the growth of pine, the chief afforestation tree of the lower Dnieper lands.
 ORIG. PUB. 7 sb.: Kharkov Univ. Press. Kharkov
 Kharkovsk. un-t, 1957, 313-320
 ABSTRACT By experiments at the Golopristanskiy Les-khoz(1953), it was established that humic fertilizers raise the vitality and drought-resistance of pine in the lower Dnieper lands. It is recommended that in nurseries humus and watering with a 0.001% solution of sodium humate be applied in combination with supplementary mineral fertilizers. It is expedient to activate planting material of a different district by wetting the root system.

Slovene with an English summary)

Abstract: Geological and chemical prospecting has led to
the discovery of a deposit of bauxites suitable for
the production of corundum. A plant constructed at
the site is now furnishing all of Yugoslavia's abra-
sives demand. ... From a summary by the authors.
