TITLE: Quantum magnetometer. Class 42, No. 164969

SOURCE: Byul. izobr. i tovar. znakov, no. 17, 1964, 40

TOPIC TAGS: magnetometer, quantum magnetometer, spin, spin resonance, spectral lamp, spectral line, rubidium, rubidium isotope, optical pumping, ESR, spectroscope, spectrometer

ABSTRACT: An Author Certificate has been issued for a quantum magnetometer which utilizes the phenomenon of spin resonance and an optical detection method for the measurement of magnetic fields. It is composed of a bulb containing an active substance in the form of a paramagnetic gas or vapor, a spectral lamp, a field coil, supply oscillators, and a photoelectric display system. To avoid a shift or widening of the spectral line of the working medium, the spins of its atoms are aligned by means of auxiliary matter, i.e. a gas or vapor which is subjected to optical pumping, for instance, the

Isotope of Rubidium-87. This auxiliary substance is contained in the same bulb as the working matter. A variant of the device uses atomic hydrogen as the working medium, which however, is not pumped. Another variant contains the working medium in several bulbs. Orig. art. has: 1 figure.

SOURCE: USSR, Gosudarstvennyy geologicheskiy komitet. Osobaya konstruktorskoye byuro. Geofizicheskaya apparatura, no. 23, 1965, 16-19
TOPIC TAGS: magnetometer, magnetic resonance

ABSTRACT: A method of filling absorption cells and depositing coatings on their inner surface in the preparation of potassium, rubidium, and cesium absorption chambers was developed at the Magnetic Laboratory (Magnitnaya laboratoriya) of the IZMIR AN SSSR. The experiment showed that the magnetic resonance signal obtained with coatings from long chain saturated hydrocarbons (e. g., tetracosane $C_{24}H_{50}$) is 1.5-2 times stronger than with alkylsilane coatings. The choice of hydrocarbon was determined by the working temperature of the absorption cell. Since the working temperature of the cesium magnetometer is 20°C, all high-molecular paraffins beginning with eicosane are suitable. In the rubi-

TITLE: Quantum magnetometer

CITED SOURCE: Sb. Geofiz. priborostr. Vy*p. 15. L., Gostoptekhizdat, 1963, 8-12

TOPIC TAGS: geophysics, magnetometer, geophysical instrument, quantum magnetometer mockup, magnetic resonance magnetometer

TRANSLATION: The authors describe an experimental mockup of a magnetometer operating on the principle of optical orientation of the atoms and magnetic resonance. The basic parts of the device are a spectral lamp filled with alkaline metal vapors and an inert buffer gas, and an absorption chamber. A distinguishing feature of the mockup in comparison to those previously described in the literature is the fact that the inside walls of the absorption chamber are covered with silico-organic compounds, resulting in a considerable rise in the signal/noise ratio. The best results are obtained with the use of dimethyldichlorsilane

Card 1/2

ACCESSION NR: AR4008229

coating and a phase-sensitive detector. The device so constructed is capable of determining the maximum of the magnetic resonance with an accuracy of up to 0.2 cycles/sec, and its sensitivity goes as high as 0.05 γ. G. Aleksandrovskaia.

TITLE: Effect of hypokinesia on work capacity in man

SOURCE: Konferentsiya po aviationskoy i kosmicheskoy meditsine, 1963.
Aviationskaya i kosmicheskaya meditsina (Aviation and space medicine); materialy konferentsii. Moscow, 1963, 226-229

TOPIC TAGS: hypokinesia, adynamia, work capacity, human energy expenditure, oxygen consumption

ABSTRACT: Experiments were performed to determine the effects of a prolonged limitation of motor activity on the physical work capability of man. Four healthy male adults, 21 to 24 years of age, were subjected to strict bed-rest for a period of twenty days. A strictly horizontal position was maintained even during meals. Physical work performed was measured at the beginning and after the completion of the experiment by having the subjects step up on a 25-cm step 100 times during a five-minute period. Oxygen consumption and certain other indices of respiratory functions were measured before, during, and after the bed-rest experiment.

Card 1/2

ACCESSION NR: AT4042683

Results of the experiment showed that oxygen consumption (an index of energy expenditure) rose from an initial level of 3372 ml up to 4433 ml on the first day after the experiment. This represents an increase of 31.4%. Oxygen consumption reached initial levels only on the tenth day after the conclusion of the experiment. A twenty-day bedrest induces a significant deterioration of the physical work capacity of man, which, apparently, is related partly to hypodynamia and partly to the adaptation of the organism to the horizontal position of the body. The increase in the amount of energy required to perform work after bedrest imposes a significantly greater load on the cardiovascular and respiratory systems.

TITLE: Cesium magnetometer

SOURCE: USSR. Gosudarstvennyy geologicheskiy komitet. Osoboye konstruktorskoye byuro. Geofizicheskaya apparatura, no. 24, 1965, 86-91

TOPIC TAGS: magnetometer, cesium

ABSTRACT: The cesium magnetometer (block diagram shown in the figure) has an output frequency proportional to the applied magnetic field. Its sensitivity is greater than 0.3 γ. The magnetometer operates on the following principle: The presence of a magnetic field causes a proportional change or splitting of the characteristic absorption frequency of the vapor in the absorption chambers (9). The ac magnetic field in the rf coils (9) causes the light to be intensity modulated. Photodiodes detect the rf modulation and return the rf energy through symmetrical amplifiers to the coils, making the system self-sustaining. The light source is a cesium lamp containing krypton gas at 1.5 mm Hg to facilitate triggering. The useful lifetime of the lamp is 2000 hr. The lamp excitation oscillator operates in the astable mode at 125 Mc and supplies the energy to the lamp through a 1.8-m RK-1 coaxial cable in order to decrease electromagnetic interference. To reduce power consumption, the bias voltage of the oscillator anode is automatically reduced from 180 to 140 v as soon as the dis-

charge is initiated. The absorption chamber is a cylindrical glass (type 3S-5K) enclosure, the inner walls of which are coated with paraffin. A metallic cesium extension is mounted on the outer side wall. A 50% reduction of the signal level in the attenuation chamber takes place in the temperature range of +15 to +29°C. The circular polarizers together with a quarter-wave mica sheet are 43% permeable at 9000 Å. Interference filters are not used because the absorption chambers contain no buffering gas. The transistorized amplifiers with gains of $(10-12) \times 10^3$ are equipped with automatic gain control to maintain output signal levels within 10% of the nominal for a 10:1 change of the input signal. The amplifier phase stability is $0.02^\circ/1^\circ\text{C}$. Gain does not vary by more than 10% in the temperature range of -10 to +65°C. The magnetometer error in the operating frequency range (70-230 kc) is

Card 2/3

L 10776-66

ACC NR: AT6000823

3-5 cps, except for the 110-135-kc band, where the error is 10-17 cps. The output frequency as a function of applied magnetic field including error allowance is $f = 349,755H_0 + 13.35H_0^2 \pm \delta f$. Orig. art. has: 4 figures and 1 formula. [BD]

TITLE: Collective excitations in a semimetal

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 49,
no. 4, 1965, 1284-1292

TOPIC TAGS: semiconductivity, Coulomb excitation, electron interaction,
band spectrum

ABSTRACT: This is a continuation of earlier work by the authors (ZhETF
48, 1184, 1965) dealing with the Coulomb interaction of electrons in
closely lying energy bands. In the present article, the authors investi-
gated the collective excitations in a two-band electronic system with
Coulomb interaction in the presence of bound electron-hole pairs. The
analysis method employed is that of V. G. Vaks, V. M. Galitskiy, and
A. I. Larkin (ZhETF v. 41, 1655, 1961), and the analysis is confined to
excitations with zero spin for the case when the pairing occurs in the
singlet state. The case of intersecting bands, which is formally similar
to the case of superconductivity, is considered. An acoustic branch,

Card 1/2

L 12784-66

ACC NR: AP5026622

which is not suppressed by the plasma oscillations (as is the case in a superconductor), but exists simultaneously with the plasma branch, is obtained when only the proper Coulomb interaction matrix elements of the interaction are taken into account. When allowance is made for the exchange matrix elements, which have a short-range character, a gap appears in the acoustic branch. The excitation energy, with moments close to zero, is found to be close to double the gap width for zero momentum transfer, and is quadratic in the coupling constant. Authors thank A. I. Larkin for useful discussions. Orig. art. has: 48 formulas.

TITLE: On the possibility of 'superthermal conductivity' in semiconductors
21, 44, 55

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 50,
no. 1, 1966, 131-134

TOPIC TAGS: semiconductor conductivity, Coulomb interaction

ABSTRACT: This is a continuation of earlier work by the authors (ZhETF v. 48, 1184, 1965), where the change in the energy spectrum due to Coulomb interaction between electrons and holes at low temperatures was discussed. It is shown in the present paper that undamped energy flow may exist in a two-band system with pairing as a result of superfluidity of the Bose condensate in which the bound electron-hole pairs are precipitated. A proof is presented of the Landau criterion for superfluidity in the case of crystal periodicity. The superfluid

Card 1/2

Z

L 16098-66

ACC NR: AP6004930

motion is stable with respect to Umklapp processes and scattering by impurities. The feasibility of simple experiments aimed at observing superthermal conductivity for narrow-gap semiconductors is discussed briefly. Superfluidity may also be the cause of the change of certain semiconductors (titanium and vanadium oxides or InSb) into the metallic state at increased temperatures or pressures. Superthermal conductivity may also be manifest by vanishing of weak antiferromagnetism. Authors thank I. Ye. Dzyaloshinskiy for discussions leading to the writing of this article. TITLE: Intensification of heat exchange in a bundle of tubes with transverse ribs placed in a longitudinally flowing stream

SOURCE: AN BSSR. Vestsii. Seryya fizika-tehnichnykh navuk, no. 2, 1966, 65-70

TOPIC TAGS: turbulent flow, turbulent heat transfer, heat exchange, hydraulic resistance

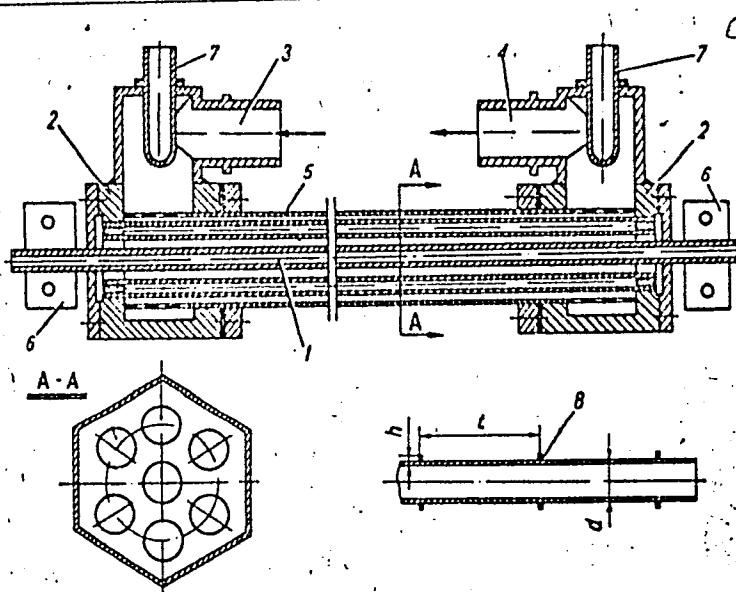

ABSTRACT: After explaining the reason why earlier investigations of longitudinal flow around bundles of tubes were not adequate, the authors report an investigation of the possibility of intensifying heat exchange in a typical array of tubes frequently used in heat-exchange apparatus. The tubes investigated were provided with fins. The outside diameter of the tubes was 12.09 mm, and the fins were made of 1 mm wire spaced approximately 36 mm apart. The bundle consisted of 7 tubes (Fig. 1), of which the central one was heated with ac, and the heat was transferred to the other tubes through longitudinally flowing water. The distance between tubes was equal to 1.5 the tube diameter. Plots of the experimentally obtained heat-transfer coefficients and hydraulic-resistance coefficients are presented and it is concluded that turbulization results in an increase of about 40 - 50% in heat transfer. The effect of different factors on the results are briefly discussed. The estimated reduction in the weight and volume of the tube bundle through the use of turbulence is about 25%.

New titrimetric procedure for determining potassium. I. V. Taranov and A. S. Kozlov. *Zhur. Anal. Khim.* 6, 149-53 (1951). This method is based on the interaction of CdSO_4 , $\text{Li}_4\text{Fe}(\text{CN})_6$, and $\text{K}_4\text{Fe}(\text{CN})_6$. The first two react to form $\text{Cd}_4\text{Fe}(\text{CN})_6$ regardless of the excess $\text{Li}_4\text{Fe}(\text{CN})_6$. The system CdSO_4 , $\text{K}_4\text{Fe}(\text{CN})_6$, CdSO_4 behaved quite differently. Up to a $\text{K}_4\text{Fe}(\text{CN})_6$: CdSO_4 ratio of 0.3 $\text{Cd}_4\text{Fe}(\text{CN})_6$ is formed. At a ratio of 0.3-0.7 a variable solid phase is formed contg. 0.0.0 mol. of $\text{K}_4\text{Fe}(\text{CN})_6$ per mol. of $\text{Cd}_4\text{Fe}(\text{CN})_6$. The complex reaction product is $8\text{Cd}_4\text{Fe}(\text{CN})_6 \cdot 4\text{K}_4\text{Fe}(\text{CN})_6$. In the 3rd stage as the $\text{K}_4\text{Fe}(\text{CN})_6$ increases further, the double salt $\text{Cd}_4\text{Fe}(\text{CN})_6 \cdot \text{K}_4\text{Fe}(\text{CN})_6$ is formed. Thus, after pptg. Cd with $\text{Li}_4\text{Fe}(\text{CN})_6$, the excess of the latter can be detd. by titration with KMnO_4 . Addn. of a K salt, e.g., KCl or KNO_3 , will cause $\text{K}_4\text{Fe}(\text{CN})_6$ to be absorbed on the Cd ppt. and form $8\text{Cd}_4\text{Fe}(\text{CN})_6 \cdot \text{K}_4\text{Fe}(\text{CN})_6$. The amt. of $\text{Fe}(\text{CN})_6^{4-}$ in soln. will thereby be reduced. A 2nd titration with KMnO_4 will indicate the amt. of $\text{Fe}(\text{CN})_6^{4-}$ removed from soln. and can be recd. in terms of K.

Use of formaldehyde in the synthesis of organic compounds
analyzed by infrared spectra. Part I. Preparation of formaldehyde
Acetone and its conversion to formaldehyde in the presence of
catalytic amounts of aluminum chloride. Preparation of 1,2-dimethyl-
formamide from acetone and formaldehyde. Preparation of methyl
formate from acetone and formaldehyde. Preparation of methyl
formaldehyde from acetone and formaldehyde. Their
physical properties and infrared spectra. It is shown that they
of great interest especially in connection with information on the
synthesis of organic compounds. A suggested procedure is to synthesize
formaldehyde from acetone and aluminum chloride. If there is no problem then
formaldehyde can be synthesized from acetone and NH₃ (about
formaldehyde). The allotropic forms of formaldehyde, crystal of solid K
formaldehyde, Aldehyde form of formaldehyde, and C₂H₄ do
not give infrared spectra. C₂H₄ does not give C/NH₃.

AUTHOR. Kozlov, A.S.

TITLE: A Fractional Reaction for Detection of Copper (Drobnaya reaktsiya obnaruzheniya medi)

PERIODICAL. Vestn. Mosk. un-ta. Ser. matem., mekhan., astron., fiz., khimii, 1957, Nr 3, pp 223-226

ABSTRACT: During the interaction of $K_4Fe(CN)_6$ with metallic Ni, Co, and Mn in a weakly ammoniacal solution with an excess of ammonium salts and Cu, pink precipitates of displaced crystals of the type $(NH_4)_2(MeCu)Fe(CN)_6$ are formed. This reaction may be utilized in the determination of Cu. The author describes a fractional reaction of Cu which is based on fractionated precipitation of $Cu_2Fe(CN)_6$ on a background of Cd salt, which is employed as a carrier. 1-5% of Cu can be determined in 5-10 cc of a solution in the presence of Cd, Ni, Co, and Mn.

A New Titrimetric Method for the Determination of Copper by Means of Potassium-Ferrocyanogen (Novyy titrimetricheskiy metod opredeleniya merti pri pomoshchi ferrotsianida kaliya)

PERIODICAL:

Nauchnyye doklady vyschey shkoly. Khimicheskaya tekhnologiya, 1958, No. 2, pp. 300-301 (1 p.)

ABSTRACT:

The composition of the deposits which are formed in connection with the action of soluble ferrocyanogens on copper salts in a neutral or acid medium is variable and depends on many factors (Refs. 1-10). The first author found (Ref. 1) that a crystalline compound of low solubility: $(\text{NH}_4)_2\text{CuFe}(\text{CN})_6$ is formed with a

certain ratio in the system $\text{Cu}^{2+} - \text{NH}_4^+ - \text{NH}_3\text{OH} - \text{Fe}(\text{CN})_6^{4-} - \text{H}_2\text{O}$. It was presumed that it can be used for the determination of copper. In order to determine precisely the range of existence of the last-mentioned compound, and to work out the conditions of the titrimetric determination of copper, 3 test series with a constant concentration of both copper and ammonia, and variable quantities of $\text{K}_4\text{Fe}(\text{CN})_6$ were carried out. As can be seen

Card 1/3

(1) Titrimetric Method
for the Determination of Copper by Means of Ammonium Ferrocyanogen

from table 1, deposits of $(\text{NH}_4)_2\text{CuFe}(\text{CN})_6$ are formed (red) in series in the case of an excess of the decomposing ferrocyanogen. A double salt is formed in the case of a small excess of copper-ions in the initial mixture. The deposit of $(\text{NH}_4)_2\text{CuFe}(\text{CN})_6$ precipitates consequently the easier the lower the concentration of the excessive copper-ions Cu^{2+} and the more intensively the solution is titrated. The red deposit passes over more rapidly over into a greenish-brown one in the case of an excess of copper in the mother solution. If the precipitation takes place under an excess of ferrocyanogen, the above change does not take place. $(\text{NH}_4)_2\text{CuFe}(\text{CN})_6$ is an intermediary product which is characteristic for the metastable state of the Cu^{2+} . NH_4^+ + $\text{Fe}(\text{CN})_6^{4-}$ - $\text{NH}_4\text{CH} \cdot \text{Fe}(\text{CN})_6^{4-}$ - H_2O -system. Nevertheless, this compound can be used for the titrimetric determination of copper. If an excess of $\text{K}_4\text{Fe}(\text{CN})_6$ is added to a weakly acidic solution of the sample to be investigated and by titration titrate with the non-reacted ferrocyanogen, K_{MnO_4} solution, the following

SOV/156-58-2-24/48

A New Titrimetric Method for the Determination of Copper by Means of Potassium-Ferrocyanogen

solution is used for this purpose in an aliquot filtrate portion. Finally, the process of analysis is described. Table 2 shows the determination of copper in oxidized copper-ores. The error is within $\pm 0.25\%$. Alkaline metals, small quantities of alkaline earths, and magnesium do not exercise a disturbing effect. Heavy metals which form insoluble ferrocyanogens must not be present. There are 2 tables and 13 references, 6 of which are Soviet.

AUTHOR: Kozlov, A.S.

TITLE: A new (nephelometric) method of determining small cesium amounts with the aid of cesium and cadmium ferrocyanide

PERIODICAL: Referativnyy zhurnal Metallurgiya, no.10, 1961, 15, abstract 10K85 (V sb. "Redk. shchelochn. elementy", Novosibirsk, Sib. otd. AM SSSR, 1960, 79 - 85)

TEXT: A study of the $\text{CdSO}_4\text{-Cs}_4[\text{Fe}(\text{CN})_6]$ - H_2O system by physico-chemical methods showed the existence of only one compound, namely, a binary salt composed of $\text{Cs}_2\text{Cd}[\text{Fe}(\text{CN})_6]$. The formation of precipitate $\text{Cs}_2\text{Cd}[\text{Fe}(\text{CN})_6]$, immediately after adding $\text{Cs}_4[\text{Fe}(\text{CN})_6]$ to the CdSO_4 solution proves the low magnitude of "threshold" Cs^+ concentration, when binary salt is able to exist, and the low solubility of the precipitate. Binary Cs and Cd ferrocyanide was synthesized by interaction of Cs_2SO_4 with $\text{Cd}_2[\text{Fe}(\text{CN})_6]$ solution in NaI. An analysis established that the composition of the precipitate corresponded to formula $\text{Cs}_2\text{Cd}[\text{Fe}(\text{CN})_6]$. The development of a new qualitative reaction for Cs and determination of the composition of the precipitate, make it possible to use this reaction for the

Card 1/2

A new (nephelometric) method ...

9/137/61/000/010/056/056
A006/A101

nephelometric determination of low Cs amounts. It is based on the formation of $\text{Cs}_2\text{Cd}[\text{Fe}(\text{CN})_6]$ precipitate in the NaI solution. Cs is determined by comparing the turbidity of the standard and test solutions. This method makes it possible to determine 0.02 - 0.2 mg Cs in 10 ml of the solution. The analysis is not invalidated by Li, Na and 100-fold amounts of K; 10-fold amounts of ammonia, Rb and heavy metals, which form precipitates with the ferrocyanide ion, prevent determination. There are 11 references.

ACCESSION NR: AP4036973

S/0078/64/009/005/1285/1288

AUTHOR: Kozlov, A. S.; Demkina, N. I.

TITLE: Coprecipitation of copper with cadmium ferrocyanide.

SOURCE: Zhurnal neorganicheskoy khimii, v. 9, no. 5, 1964, 1285-1288

TOPIC TAGS: copper, precipitation, removal, copper cadmium ferrocyanide coprecipitation, condition, copper ion capture, mechanism, adsorption, mixed copper cadmium ferrocyanide

ABSTRACT: The process of coprecipitating copper with simultaneous partial precipitation of the macrocomponent (cadmium ferrocyanide) was studied quantitatively. The effect of the amount and concentration of precipitant, ratio of macro- and microcomponents, and time of aging and temperature was evaluated. When the cadmium concentration is 5 mg/ml and copper is 0.5-2.5 microgm/ml, the copper is precipitated quantitatively with only 2% cadmium. In a 3-stage operation for the quantitative precipitation of copper with the cadmium, less ferrocyanide is required than in a single stage operation. Coprecipitation of copper fails rapidly with increase in cadmium content, and increasing the temperature also

Card 1/2

ACCESSION NR: AP4036973

reduces the coprecipitation of copper. When the amount of CdSO₄ in solution exceeds 2 gm/l almost no copper is precipitated. The optimum K₄Fe(CN)₆ concentration is 0.01-0.05 M. If the cadmium and copper are freshly coprecipitated, the copper is captured quantitatively by the macrocomponent; on aging 3 hours the amount of copper captured is reduced to zero. It is therefore concluded that pure adsorption is not the mechanism, and that possibly mixed copper-cadmium ferrocyanides are formed. This will require further study. Orig. art. has: 5 figures and 1 table.

Report. This book is intended for metallurgical engineers, research workers in metallurgy, and may also be of interest to students of advanced courses in metallurgy.

Comment: This book, consisting of a number of papers, deals with the properties of heat-resistant metals and alloys. Each of the papers is devoted to the study of the behavior which arises due to properties and characteristics of metals. The effects of various elements such as Cr, Ni, and Mo on the heat-resisting properties of various alloys are analyzed. Deformability and workability of certain metals is related to the thermal conditions are the object of another study described. The problems of hydrostatic whitening, diffusion and the deposition of ceramic coatings on metal surfaces by means of electrochemistry are analyzed. One paper describes the operation and methods used for finding microcracks of metals. Boron-base metals are critically examined and evaluated. Results are given of studies of intermetallic bonds and the behavior of atoms in metal. Data of turbine and compressor blades are described. No generalities are mentioned. References accompany most of the articles.

179-187)

TEXT: In connection with the problem of employment of hydraulic brakes in obtaining deceleration of high absolute magnitudes in a moving body, the motion of a plunger is considered, which enters a fluid-filled chamber with high velocity and moves in it with little clearance between the plunger and the walls of the chamber. Equations of motion of the plunger are given, with the leakage of the fluid through the clearance. An analogical problem is considered for the case when the fluid leaks not around the plunger, but through a calibrated valve situated in

TEXT: When calculating the intensities of different waves by the radial method, and also when constructing kinematic hodographs, it is necessary to know the distances which pass the front of a wave along the whole of its path of propagation. For an arbitrary case of the environmental structure, this problem may be solved with the help of stereographic projections (Wolff nets). Formulas are cited for the case of a plane

inclined boundary surface; these enable the depth, epicentral distance, and hypocentral distance of the point of intersection of the ray and the boundary surface to be computed. Graphs are presented which substantially simplify calculation of these elements. The method could also be extended to the case of several flat inclined boundary-surfaces. *[Abstracter's note: Complete translation.]*

TITLE: The attenuation of body waves with distance for the earthquakes of Tadzhikistan

SOURCE: AN SSSR. Izvestiya. Seriya geofizicheskaya, no. 4, 1964, 575-578

TOPIC TAGS: earthquake, body wave, wave attenuation, seismograph, seismic wave

ABSTRACT: This work is devoted to a study of earthquakes having their foci within the crust. It is based on records of high-sensitivity instruments at expeditionary stations in Tadzhikistan (a magnification on the order of 15 000-20 000 in the 0.5-0.7 sec range of periods). Local conditions were isolated by selecting 48 deep-focus Afghan earthquakes such that the distance and direction to all expeditionary stations were approximately the same. In this way, any differences in the records could be interpreted as effects of local conditions. The energy density was then determined for each investigated earthquake at each station. Differences in energy as measured appeared greater than any value due solely to errors of measurement. Tadzhikistan earthquakes with foci in the earth's crust appear to have a frequency

Card 1/3

ACCESSION NR: AP4033021

distribution similar to the deep-focus Afghan earthquakes. Periods from 0.1 to 0.5 sec dominate in both groups. This permits the correction factor used for Afghan earthquakes to be used in treating the near earthquakes of Tadzhikistan. Attenuation of the waves with distance is shown in Fig. 1 on the Enclosure for both longitudinal and transverse waves. The attenuation coefficient of energy density increases with focal depth. This may be explained in one of two ways. The number of interfaces increases with depth, and this accounts for scattering and secondary absorption of energy in the intervening layers. And, the deeper the focus the higher the dominant frequency of the earthquake; high frequencies die out more rapidly than low frequencies (which dominate in shallow earthquakes). Orig. art. has: 2 figures and 4 tables.

TITLE: Results of comparing theoretical and experimental characteristics of seismic waves

12,44,55

SOURCE: AN TadzSSR, Institut seysmostoykogo stroitel'stva i seismologii. Trudy, v. 12, 1964. Sbornik statey po seismologii (Collection of articles on seismology), 31-42

TOPIC TAGS: seismic wave, earthquake, damping factor, absorption coefficient, earth model, earth crust

ABSTRACT: Some results of comparing theoretical and experimental amplitude curves of seismic waves are described. The discussions are devoted to the possible presence or absence of lower-velocity layers in the crust and to the possibility of absorption of seismic-wave energy in the crust. Six variant hypotheses of earth crustal structure are assumed as models, three of these proposing lower-velocity layers within the crust. Computed values of amplitude and damping for each of these were compared with experimental data. The damping factor declines

with increase in focal depth, indicating that no thick layers of lower velocity occur in the crust. It is not yet possible to state reliably that thin layers of lower velocity do not occur. A comparison of experimental data on damping with theoretical computations indicates that damping of seismic waves must occur within the crust. For a multilayer crust, the absorption coefficients $a_0=0.03$, $a_{1,2}=0.02$, and $a_3=0.01$ appear to represent the upper limits of absorption in the crust. For a one-layer crust, a value of $a = 0.03$ gives a value very near the actual. Orig. art. has: 7 figures and 5 tables.
