Kozlovskiy, V. Kh. [Leningrad, Institut khimii silikatov AN SSSR (Institute for Silicate Chemistry, AS USSR)] "Structural Losses In Amorphous Dielectrics."

(The Physics of Dielectrics; Transactions of the All-Union Conference on the Physics of Dielectrics) Moscow, Izd-vo AN SSSR, 1958. 245 p. 3,000 copies printed.

This volume publishes reports presented at the All-Union Conference on the Physics of Dielectrics, held in Dnepropetrovsk in August 1956, sponsored by the "Physics of Dielectrics" Laboratory of the Fizicheskiy institut imeni Lebedeva An SSSR (Physics Institute imeni Lebedev of the AS USSR), and the Electrophysics Department of the Dnepropetrovskiy gosudarstvenny universitet (Dnepropetrovsk State University).

AUTHOR: Kozlovskiy, V. Kh. 48-22-3-13/3c

TITLE: Structural Losses in Amorphous Dielectrics (Strukturnyye poteri v amorfnykh dielektrikakh)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, 1958
Vol. 22, Nr 3, pp. 279-282 (USSR)

ABSTRACT: Dielectric losses in amorphous dielectrics (e.g. in glass) are divided into three types: 1) Conductivity loss, 2) relaxation losses and 3) structural losses. The relaxation losses are caused by the presence of certain additional ions, e.g. alkali. Their nature was investigated both experimentally and theoretically in the works by Skanavi (Ref 1). With respect to structural losses it is observed that they are caused by the nature of the glass-forming oxide. For this reason, the author, when investigating the structural losses, neglects the two first-mentioned types as well as the ions causing them. In the case of lacking relaxating ions, the absorption of the electromagnetic energy by the amorphous dielectricum must be practically of the same nature as its absorption by the crystal. The losses in the glass must be of the resonance type; they then do not depend on temperature. The resonance absorption exists in crystals, however, only with certain frequencies

Card 1/3

Structural Losses in Amorphous Dielectrics

48-22-3-13/30

within the infrared range and with glass in a large interval of frequency. The cause of these fundamental differences must be found. In an ideal crystal, absorption is connected with two kinds of resonance, viz. According to frequency and according to the wave vector. In the amorphous structure, the forced oscillations are no plane waves and therefore the conception of the wave vector and the restrictions connected here with does no longer exist. Lifshits (Ref 3) investigated the absorption of the electromagnetic energy by the crystal with slightly deranged periodicity. Complicated calculations showed that the interruption of the periodicity leads to the absorption of energy within a range of frequency that would be inactive in an ideal crystal. Concluding, the author states that Frenkel' (Ref 5) tried to explain the temperature-dependant loss-components in glass. He suggested a mechanism for the transformation of the electromagnetic energy of the field into accustic medium-oscillations at the expense of the metal-ions contained. The calculation of the energy which is lost by the acoustic vibrator (Ref 6) showed, however, that acoustic emission influences the losses only very slightly.

The losses are obviously mainly connected with dissipation

Card 2/3

Structural Losses in Amorphous Dielectrics

48-22-3-13/30

processes. V. A. Ioffe (Ref 4) presumed that the losses in glass within the range of ultra-high frequencies are caused by the presence of a great number of resonators with frequencies of their own. There are 6 Soviet references.

 torial Board; (Rep. Ed.) G.V. Danilev, Doctor of Physics and Mathematics;
 (Deceased); and E.T. Filippova, Candidate of Physics and Mathematics.
 PURPOSE: This collection of reports is intended for scientists investigating
 the physics of dielectrics.

CONTENTS: The Second All-Union Conference on the Physics of Dielectrics held in
 Moscow at the Physico-Mechanical Institute I.M. Lelbedeva (Physico-Mechanical
 Institute of the USSR) in November 1953 was attended by representatives from
 scientific centers of the USSR and of several other countries. The collec-
 tion contains most of the reports presented at the conference and summaries
 of the discussions which followed. The reports in this collection deal with
 dielectric properties, losses and polarization, and with specific inductive
 capacities of various crystals, chemical compounds, and ceramics. Photo-
 tests on dielectrics are investigated, and various radiation and irradiation ef-
 fects on dielectrics are investigated. The volume contains a list of other
 publications of the conference dealing with polarization, losses, and
 SSSR, series *Dielektrika*, No. 2, 1953. No personalities are mentioned.

TITLE:

A Dynamic Theory of the Deformed Ion Lattices of
Seignettoelectric Crystals

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 8, pp. 1733-1738

TEXT: The general method of the mathematical description of seignettoelectric phenomena in crystals is based on a development of the lattice energy potential in a power series of the ion displacements, taking into account terms of at least up to the fourth order. As Born has shown, in order to include deformation, terms of order higher than the second have to be considered. In the present work a further development of Born's theory is made for seignettoelectric crystals in which the direction of spontaneous polarization does not coincide with the crystal axes. Since the consideration of ionic vibrations under non-linear forces requires extensive calculations, the author limits his consideration to linear vibrations (taking place in the x-direction). X

A Dynamic Theory of the Deformed Ion
Lattices of Seignettoelectric Crystals

S/181/60/002/008/008/045
B006/B070

The potential energy of the ion is developed in a power series of the displacements along the x-axis and terminated at the fourth order term. Expressions of free energy of seignettoelectrics are obtained as functions of powers of polarization and deformation. The temperature dependence obtained for the coefficients P² and P⁴ suggests the possibility of phase transitions of the first and the second kind. Finally it is shown that the seignettoelectric properties of a crystal can be related to interaction forces in a crystal lattice (3.9) - (3.11). It is remarked, in conclusion, that a generalization of Born's theory by taking into account anharmonic forces may lead to a correct description of many seignettoelectric properties of crystals. TITLE: On the structure of substances fixing polarization

PERIODICAL: Referativnyy zhurnal, Fizika, no. 10, 1962, 27, abstract 10E20⁴
("Izv. Leningr. elektrotekhn. in-ta", 1961, no. 46, 303 - 307)

TEXT: The electrostatic energy of a substance (crystalline or amorphous) conserving the polarized state after removal of the external field is calculated on the assumption of the substance being comminuted into submacroscopic regions with different directions of polarization. The calculation is performed by taking account of both the presence of a free charge $q_f = -\alpha g$, where $0 < \alpha < 1$, which partly compensates the polarization charge on the interfaces, and the difference between the effective field in the boundary layer and the field in the bulk. It is found that there is a minimum of energy for a given dimension of the region, and that there is an equilibrium dimension of the region depending on α . ✓/B

TITLE: Dynamic Relaxation of Ferroelectric Ions in a Self-consistent Field /Report of All Union Conference on Ferroelectrics held in Rostov-on-Don 1974 (Bulgakov)

SOURCE: AN SSSR. INVESTIGAT. SER. FIZICHESKAYA, V.29, NO.6, 1965, 874-878

TOPIC-TAGS: ferroelectricity, phase transformation, relaxation kinetics, statistical thermodynamics

ABSTRACT: In his theory of ferroelectrics, J. Mason (Phys. Rev. 72, 854, 1947) considered the motion of an ion between two minima of a potential well but not the motion of the ion in the minima themselves. In the present paper the author attempted to describe this motion by means of dynamical equations and to determine its influence on the properties of the ferroelectric. A simple form is assumed for the potential well and the ion is assumed to be influenced in addition by an effective self-consistent field. The free energy is calculated and equa-

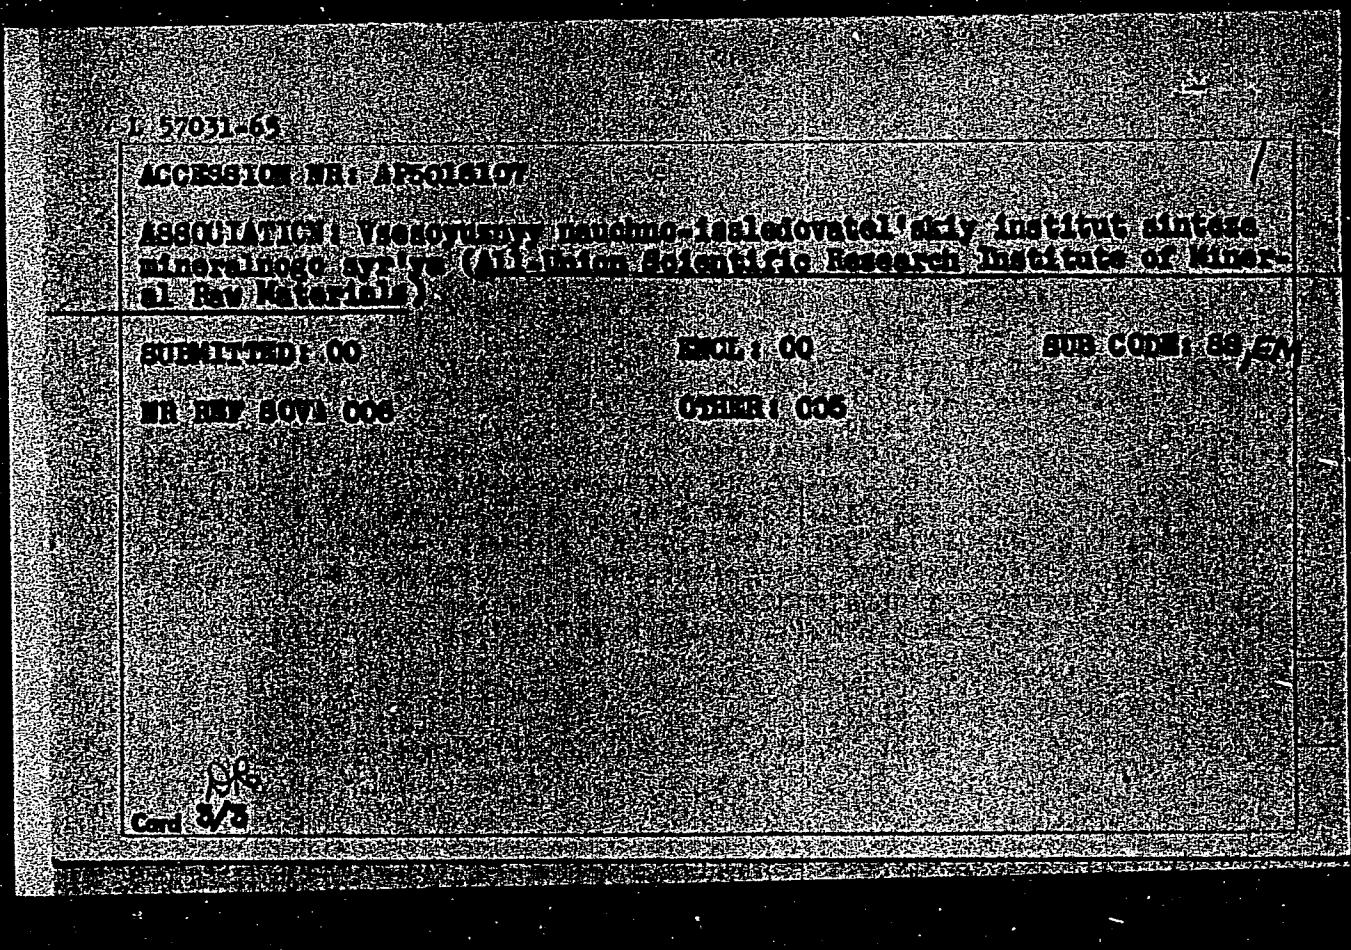

Card 1/3

tions are derived describing a dynamic phase transition corresponding to the change from vibration of the ion within the minima to free vibration over the potential barrier. Equations are also obtained which describe an order of second transition which can occur at a temperature below that of the dynamic phase transition. The resonance frequency for infrared absorption is taken as the temperature approaches that of the dynamic phase transition. Such a change of resonant frequency does not occur when the temperature approached the order of the phase transition temperature. The resonance lines of the two levels which are doublets; the doublet separation is calculated. The doublet splitting may be large in the case of rigid crystal lattices such as perovskite. Quantum effects are discussed briefly. It is shown that replacing the oxygen atoms by nitrogen increases the activation energy and the relaxation time. This is in agreement with experimental findings of RIKLI and SPOKON (Phys. Rev., 138, 1140, 1965). Oxygen has 34 electrons.

UV/004B/65/083/065/0000000000000000

AUTHOR: ROBERT V. SEIDENBERG

TITLE: Phase transition in the ferroelectric crystal with domain walls
/Report, Actin Al Union Conference on Ferroelectrics, held in Roatov,
on-the-Dniestr, 1964.

SOURCE: AN BSBR - 1971-1972 POLITICAL CHANGES IN SO. ZG. S. 1945-1949-1950

TOPIC TAGS: nanotechnology, phase transformation, domain structures, free energy

ABSTRACT: The author discusses phase transitions in a ferroelectric crystal containing domain walls. The surface energy, including the energy of the domain walls, is calculated, and from this is derived an expression for the free energy of a grain containing a number of closely spaced pinning points of domain walls. At several points in the derivation the author obtains certain known complex calculations which confirm his results. (Received August 20, 1956; revised October 10, 1956.)

yr 8, 819, 1963) and does not always explain the meaning of the symbols thus far. According to the 1943 edition of the "Handbuch der Physik" (which is derived from the three German people), there are different, depending on the value of α , two types of coexisting regions describing the transition between the single-domain state and the multi-domain state. 1) If the domain size is very small (from 10 to 100 μ) only the Ewald-Acras (1931, 1932, 1934) solution holds. 2) There may be a stable two-phase polydomain state at low temperatures which passes at some temperature into the paraelectric state. In the case of the equilibrium transition of the domain, there may be a metastable single-domain state in addition to the stable polydomain state. In this case the single-domain state ceases to be metastable (becomes unstable) at a lower temperature than the transition temperature to the stable paraelectric state. The metastable single-domain state can be eliminated by applying the ferroelectric voltage in a capacitor and short-circuiting the plates. This was first pointed out by V.L. Ginzburg (zvezdy, No. 15, 709, 1945). - Ov. S.

CH ✓ The reaction of serum to titration with mercuric chloride,
V. N. Kozlovskii (Central Post-Graduate Med. Inst., Moscow), "Laboratory Data", No. 3, (07/12/1956).—The re-
action is based upon the study of the Takata-Ara test.
Nonhemolyzed serum (0.6 cc.) is diluted with 1 cc. of saline
and titrated with 0.1% $HgCl_2$ until complete turbidity.
The titration must proceed continually with even speed.
The results are expressed in the cc. of $HgCl_2$ solution necessary
to produce complete turbidity (normal—1.6–2.4 cc.; less
than 1.3 cc. is pathologic; in cirrhosis of the liver the values
vary from 0.8 to 1.3). It is more sensitive than the T.-A.
test.

*A simple method for determination of the total protein and protein fractions in blood serum (Russian text) SOVETSK. MED. 1953, 3 (42-43) Tables 1

The determination of proteins using the turbidity produced by HNO₃ in a suitably diluted sample, as described by Shulzew (Sovjetsk. Med. 1947, No. 3 and 1949, No. 6) is used. Fibrinogen is estimated from the difference of the protein content in plasma before and after recalcification, globulins are salted out with sodium sulphate and calculated also from the difference between the original serum and globulin-free filtrate.

Title : The toxicity of prune, cherry and apricot pits

Periodical : Priroda 3, 112-113, Mar 1954

Abstract : A warning is given against the consumption of the kernels from prune, cherry and apricot pits, because of their high poisonous effects. It is explained that these pit kernels contain amygdalin glucoside, which, under the effect of the digestive fermentations in the gastric-intestinal tracts decompose into glucose and poisonous hydrocyanic acid. The toxicity of these kernels may sometimes prove fatal.

The effect of lymphoid tissue upon calcium metabolism.
V. S. Kozlovskiy (Sci. Research Inst. Orthopedics and
Traumatol., Kiev). *Bull. Expl. Biol. Med.* 38, No. 9,
42-4 (1954). In previous investigations it was established
that ext. obtained from lymph nodes affect the Ca content
of the skin, muscles, and serum. A similar observation was
made while studying the effect of the ext. upon the Ca of the
xiphoid cartilage and the compact mass of femur. Rabbits
with normal serum Ca were used as test animals. Following
the ext. injection the cartilage Ca increased 13.1%, that of
the femur only 1%. The ext. also affected the Ca of
splenectomized animals, causing an increase of 97% in the
xiphoid cartilage and 7.3% in the femur. A callus formed
after expil. noncomplicated fracture of the anterior extremi-
ties contained 20% more Ca than the bones of controls.

TITLE: A device for damping vibrations. Patent No. 172258

SOURCE: Byulleten' Inobreniya i izobryatii, no. 12, 1965, 145

TOPIC TAGS: vibration, vibration damping, mechanical vibration

ABSTRACT: This Author's Certificate presents a device for damping vibrations transmitted to the bottom of liquidoperated instruments such as a percolator. The device consists of a base, a lever and springs (see Fig. 1 on the drawing). To dampen the vibrations, a cavity is formed in the base, constructed in the form of a hemispherical hollow. The base is mounted in the bottom of a vessel installed in the direction of flow of water within the spherical cavity in the bottom. The cavity has a diameter of

TITLE : The Destructive Distillation of Wood in Quartz-Glass Retorts

CRIG. PUB. : Przemysl Drzewny, No 3, 24-27 (1959)

ABSTRACT : The wood in the retort is decomposed by the continuous action of a mixture containing 30% steam and 20% of other gaseous products, assuring the production of a sufficiently concentrated solution of calcium acetate and other valuable products from the tar water. The optimum distillation conditions are as follows: size of the wood chips, 150-200 mm; moisture 15%. The use of forced draft in circulating the hot gases heating the retort results in uniform heating of the latter.
