Sovetskaniye po razbital'nym sposobam fundamentostroyeniya na tekhnicheskoy gruntekh

Tretyy... (Transactions of the Conference on Efficient Methods of Building Foundations on Permafrost Soils) Moscow, Gosstroyizdat, 1959. 131 p. Errata slip inserted. 1,200 copies printed.

Ed. of Publishing House: E. M. Borshchevskaya; Tech. Ed.: Ye. L. Tsvetina.

FRONTIS: This book is intended for construction engineers, industrial planners and builders.

COVERAGE: This book contains reports originally read in Vorkuta in 1958 on experience gained in planning and building foundations in permafrost regions of the USSR. The reports were prepared for publication in the NIIOBP (Scientific Research Institute for the Study of Foundations and Underground Structures). The introduction was written by Professor V. G. Bulychev. No references are given.

AUTHOR: Kravchenko, I. M.
TITLE: Wind profile in the ground layer
PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya
geofizicheskaya, no. 3, 1963, 498-499

TEXT: The turbulent-energy equation for a horizontally homogeneous air flow in the ground layer in the steady state is used to establish the following expression for the wind profile

$$\frac{\partial \bar{u}}{\partial z} = \frac{u_*}{kz} \left[\frac{\psi(Ri)}{1 - \alpha Ri} \right]^{1/2} \quad (8)$$

where $\alpha = K_h/K_m$; K_m , K_h are the momentum and heat transfer coefficients; Ri is the Richardson number. By using various expansions for $\psi(Ri)$, this expression may be shown to include

Card 1/2

Wind profile in...

S/049/63/000/003/005/005
D218/D307

various formulas for the velocity profile reported by other authors. For example, if it is assumed that

$$\psi(Ri) = 1 + \gamma Ri \tag{9}$$

then

$$\frac{\partial \bar{u}}{\partial z} = \frac{u_*}{kz} \left(1 + \frac{\alpha}{2} Ri \right) \tag{13}$$

PHASE I BOOK EXPLOITATION

SOV/1852

Kravchenko, Ivan Varfolomeyevich

Letchiku o meteorologii (Meteorology for Pilots) 2nd ed., rev. and enl. Moscow, Voenizdat, 1958. 255 p. Number of copies printed not given.

Ed.: K.F. Tresvyatskiy, Lt. Colonel; Tech. Ed.: I.M. Dozhdev.

PURPOSE: The book is intended for military flight personnel, students at DOSAAF aviation schools, members of aeroclubs, and aviation meteorologists. It can also be used advantageously by a wide range of readers interested in the problems of meteorology.

COVERAGE: This textbook on meteorology, the 2nd edition of the work, contains a detailed description of the methods used in studying the atmosphere, its structure and composition, as well as the most important individual meteorological factors and their distribution over the USSR. Chapters dealing with jet currents, thunderstorm phenomena, icing of airplanes and helicopters, have been widely

Card 1/5

Meteorology for Pilots

SOV/1852

expanded. Such problems as the aerial reconnaissance of weather conditions, the evaluation of meteorological conditions before and during the flight, and flight in stormy weather have been given more detailed treatment. No references are given.

AUTHOR: Kravchenko, I.V. (Moscow) 26-58-7-20/48
TITLE: Winter Thunderstorms in 1958 (Z. mniye grozy v 1958 godu)
PERIODICAL: Priroda, 1958, Nr 7, pp 89-91 (USSR)
ABSTRACT: Between January and the beginning of March 1958, frequent clashes of warm subtropical and cold arctic air were recorded. On the borders of these air masses cyclonic effects were produced that attained speed of 90 to 100 km/hr over Soviet territory. Such cyclones were recorded over Khar'kov on 9 February and in the Moscow Oblast on 9 and 10 February. The storms had hurricane speeds of 30 to 40 m/sec. The sudden transfer of warm and moist air from the Atlantic Ocean to the European part of the USSR caused many winter thunderstorms that were recorded over various cities. Within the first 3 months of 1958, seven thunderstorm centers were recorded. There is 1 chart and 1 Soviet reference.

PHASE I BOOK EXPLOITATION SOV/6033

Kravchenko, Ivan Varfolomeyevich

Letchiku o meteorologii (Meteorology for Pilots) 3rd ed. rev. and enl. Moscow, Voenizdat, 1962. 313 p. 14,000 copies printed.

Ed.: K. F. Tresvyatskiy, Lieutenant Colonel; Tech. Ed.: T. F. Myasnikova.

PURPOSE: This book is intended for military and civilian pilots and for students of aviation schools; it can also be used by aviation meteorologists as a text-book for training flight personnel.

COVERAGE: The present volume is the third edition of an aviation meteorology handbook revised and enlarged to incorporate the results of recent research work conducted in the USSR and abroad in this field. The effect of meteorological conditions on flight range and altitude, and on flight safety at high altitudes, has been analyzed in great detail. Particular attention is given to

Card 1/1

Meteorology for Pilots

SOV/6033

the influence of pressure, air density and temperature upon the flight conditions. Jet streams and conditions of flight in them over the territory of the USSR are described. The most recent researches on flight safety in thunderstorm zones and under icing conditions are included. Examples of aviation climatological descriptions of air routes and airports are given. Considerable space is devoted to discussion of aerial weather reconnaissance and the evaluation of meteorological conditions before and during flight. Basic principles of forecasting the weather along the flight course and over the airport are outlined, including the use of ground and high-altitude weather maps. A table of synoptic symbols is appended.

Effect of calcium sulfate on the process of hydration of the calcium aluminates $\text{CaO} \cdot \text{Al}_2\text{O}_3$ and $3\text{CaO} \cdot \text{Al}_2\text{O}_3$. P. P. Budnikov and I. V. Kravchenko. *Kolloid. Zhur.* 13, 408-11 (1951).—Action of H_2O on $\text{CaO} \cdot \text{Al}_2\text{O}_3$ (I) and $3\text{CaO} \cdot \text{Al}_2\text{O}_3$ (II), both made by melting together Al_2O_3 and CaCO_3 , results at 90° in formation of $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 7\text{H}_2\text{O}$ (III) and at 70° in formation of $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$ (IV). III forms spherulites, which cause great strength of the cement, whereas IV forms sep. crystals in a matrix of the cement, and thus gives rise to weak cement. The strength of cement setting at high temp. is improved by addn. of CaSO_4 , which induces formation of $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 3\text{CaSO}_4 \cdot 31\text{H}_2\text{O}$ (V) and $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{CaSO}_4 \cdot 12\text{H}_2\text{O}$ (VI). I and II in H_2O give also small amts. of $\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 10\text{H}_2\text{O}$ (VII) and $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 12\text{H}_2\text{O}$ (VIII), resp. The n_s of these hydrates are: IV 1.605, V 1.464 and 1.460, VI 1.504 and 1.480, VII 1.480, and VIII 1.828 and 1.825. When 3 parts gypsum was shaken with 7 parts I, II, or cement (contg. 65% I), and a large amt. of H_2O , and CaO , Al_2O_3 and SO_3 were detd. in the filtrate from time to time, it was found that the main amt. of gypsum was bound by II within 1 hr., by I within 3 days, and by cement within 7 days. Title: Expanding Gypsum-Alumina Cement

Original

Periodical: Stroit. materialy, izdeliya i konstruktsii, 1956, No 3, 10-12

Abstract: Description of the results of tests of specimens of gypsum-alumina cement (GAC) up to 5 years old. Strength after 5 years of rigid consistency specimens both tensile and compression are higher than the 3 day old strength ($\sim 340 \text{ kg/cm}^2$) which determines the grade of cement. In contrast with alumina cement strength of GAC is retained at 35-37° almost unchanged for one year. Frost resistance of specimens of plastic consistency of 1:2 composition, by weight, is high (up to 250 cycles) and does not depend on magnitude of linear expansion (0.14-0.37%). Specimens of concrete withstand up to 200 cycles

Card 1/2

USSR/Chemical Technology - Chemical Products and Their Application. Silicates.

Abst Journal: Referat Zhur - Khimiya, No 19, 1956, 62355

Abstract: of tests. Addition of naphtha soap has detrimental effect on strength of GAC at an early age and has no beneficial effect on frost stability. Expansion of GAC decreases if the gypsum rock contains anhydride. GAC causes no corrosion of reinforcements after 5 years.

Expanding, rapid-setting cement. I. V. Kravchenko. U.S.S.R. 104,107, Feb. 23, 1967. Addn. to U.S.S.R. 101, 67a. An expanding, rapid-setting cement is made of a mix of portland cement clinker 50-75, gypsum dihydrate 5-15, and active mineral additive 10-30%. To decrease the cost of this cement and to broaden the choice of raw materials, up to 15% of crude bauxite is incorporated into the mix as substitute for aluminous cement. M. Hasek

PERIODICAL: Gornyy Zhurnal, 1958, Nr 1, pp 76-77 (USSR)

ABSTRACT: This article is a critical review of the Maslenikov article published in Gornyy Zhurnal, 1956, Nr 12. The reviewers conclude that Maslenikov's article does not contain any recommendations on the choice of sample sizes for tests. The article under review contains numerous inaccuracies and false assertions, and introduces only confusion in the solution of the problem in question. There is one Soviet reference.

PERIODICAL: Kolloidnyy zhurnal, 1959, Vol XXI, Nr 1, pp 9-17 (USSR)

ABSTRACT: The article deals with research into the hydration processes of calcium monoaluminumate. The results of the experiments, done at various temperatures and humidity conditions and at different ratios between the solid and liquid phases, are described in detail. They showed (tables 1-3 and thermograms 1-3) that the general hydration process and the recrystallization rate of hexagonal calcium hydroaluminumates into the cubic form were accelerated with a rise in the temperature and humidity, especially at the temperature of 45° and under water conditions. The results also showed that the strength properties of the hydrated calcium monoaluminumates are independent of

Card 1/2

SOV/69-21-1-2/21

Research on The Hydration Processes of Calcium Monoaluminate

their liquid-solid ratio. The analysis of a 3-month-old sample, hardened in water at 45°, showed that the hard mass was composed mainly of $3\text{CaO}\cdot\text{Al}_2\text{O}_3\cdot6\text{H}_2\text{O}$, and of the gibbsite. The strength of the sample increases with time, and after 1 year exceeds the strength of samples hardened under different conditions. 3 sets of thermograms and 9 references, 4 of which are Soviet, 2 French, 2 German and 1 English.

TITLE: The production of a quick-hardening cement at a Zdolbunov Cement-Slate Plant

SOURCE: Ref. zh. Khimiya, Part II, Abs. 11M192

REF SOURCE: Nauchn. soobshch. Gos. Vses. n. -i. in-t sementn. prom-sti, no. 20(51), 1965, 36-41

TOPIC TAGS: cement, quick hardening cement/Zdolbunovskiy Cement Slate Plant

ABSTRACT: A technology was developed for manufacturing very quick-hardening cement with a hardening strength of 300 kg/cm² after one day, 450 kg/cm² after three days, and 700 kg/cm² after 28 days. At the Zdolbunov Cement-Slate Plant the base mixture is made from hard chalk, clay, and loams, containing a considerable quantity of large-crystal quartz; calcining was conducted in rotating furnaces, 118 and 170 m long. The physicochemical properties of the base components were studied, and the effect of the following factors on the cement strength was analyzed:

Card 1/2

~~LOS 895-67~~
~~E 05985-67~~

ACC NR: AR6031251

the type of fuel, the method of grinding the clinker, and the reactivity of the components. The reactivity of the base mixtures was found to be low, since 30--45% SiO_2 was present in the form of quartz particles larger than 15μ . The cross-

sectional view of the manufactured slurry showed large quartz crystals, $\leq 250 \mu$. The best results with respect to cement strength and furnace productivity were obtained with clinkers containing 55--63% C_3S and 7--8% C_3A when $n = 2.3-26$, and $p = 1.2-1.4$. The required cement strength was obtained when the specific $3500-4000 \text{ cm}^2/\text{g}$, while the specific surface should be $5000 \text{ cm}^2/\text{g}$ when calcining the clinker in a solid fuel. Mills, operating in open or closed cycles can be used: the temperature of the clinker being fed into the mill should not exceed $70-80^\circ$ in the first case and 100° in the second case, and 100° at the outlet from the mill.

ORG: Main Office of the Hydrometeorological Service (Glavnoye upravleniyo Gidrometeoslužby)

TITLE: Conference of directors of hydrometeorologic and meteorologic services of socialistic countries in Europe

SOURCE: Meteorologiya i gidrologiya, no. 8, 1966, 46-49

TOPIC TAGS: meteorological service, hydrometeorological service, weather service, agriculture meteorology, synoptic meteorology, meteorotelecommunication, meteorologic conference

ABSTRACT: The Eighth Conference of Directors of Meteorological and Hydrometeorological Services of the socialist countries in Europe was held in Moscow from 21 to 28 February 1966. Besides delegations from these countries, a delegation from the Mongolian Peoples' Republic and Dr. M. Rodrigues Ramires, Director of the Meteorological Institute of Cuba, also participated. The Director of the Federal Office of Hydrometeorological Service in Yugoslavia, M. Perovich, and a representative of the European and Asiatic region of the International Geophysical Cooperation, Dr. G. Skayl, were observers.

The plenary meeting under the chairmanship of Academician Ye. K. Fedorov established three working committees and a working group on hydrology. Problems on cooperation between services, worldwide weather service, climatology, agriculture meteorology, aviation and synoptic meteorology, meteorological telecommunication, hydrology, and a unified system of hydrometeorological instruments were discussed. It was decided that before the next directors' meeting (planned for the first half of 1967 in the German Democratic Republic), the following group meetings would be held: climatology in January 1967 in Warsaw, meteorological telecommunication in conjunction with a seminar on the radioactivity of the air in September 1966 in Prague, and an editorial board to work on the description of aviation routes in June 1966 in Budapest.

Regulations for the directors' conferences, as proposed by the Hydro-meteorologic Service of Poland, were adopted at the Moscow conference. They contain provisions for cooperation in meteorology, hydrology, and oceanology, and participation in meetings of socialist countries outside of Europe. German, Russian, and the language of the host country are to be used at the conferences. A unified synoptic code was accepted for meteorological observations. A mutual exchange of observational data on ozone was recommended, and the ozone problem will be studied in the seminar in Germany in September 1966.

The problem of the use and distribution of radar observations for weather purposes was discussed, and an interchange of information was asked for.

Card 2/3

ACC NR: AP7003022

Problems of applied climatology were discussed, and unified processing of climatologic data was accepted, as well as the use of unified meteorological instruments. The conference recommended an exchange of hydrological observation data, improved collection and dissemination of meteorological information from Turkey, Greece, and the Near East, and telegraph networks for improved exchange of airport weather data. Reports of the USSR Hydro-meteorological Center on the numerical processing of forecast data were heard. Orig. art. has: 2 figures. [ATD PRESS: 5080-F]

TITLE: Investigation of torque characteristics of pulse electromagnetic drives

SOURCE: IVUZ. Elektromekhanika, no. 7, 1966, 773-780

TOPIC TAGS: electromagnet, electric engineering

ABSTRACT: The authors analyze the case of drive of a mechanism the applied mass of which on the electromagnet armature is constant or changes insignificantly with time, so that the changes can be ignored. The investigation is limited to the primary function of an electromagnet, when it moves only the actuator mechanism, not when the armature is loaded with other additional forces. The torque characteristics of electromagnets are analyzed in dependence on the form of the air gap between the armature and the stop. A two stage torque characteristic is useful to reduce shock loads in the actuating mechanism. The usage of a two stage torque characteristic in combination with a return spring can reduce or completely eliminate shock loads in the actuating mechanism. With identical parameters of the process, torque characteristic variants with force changes require a considerable increase in initial electromagnet force and strength of the mechanism. TITLE: Contact glass-textolite VPS-4¹⁵

SOURCE: Plasticheskiye massy, no. 1, 1966, 52-56

TOPIC TAGS: polymer, polymerization, glass cloth, glass fabric, glass fiber, fiber glass/ 1LED5M binding agent, VS4 glass textolite, St911S glass textolite, VPS 2 glass textolite, FN glass textolite, ASIT glass fabric

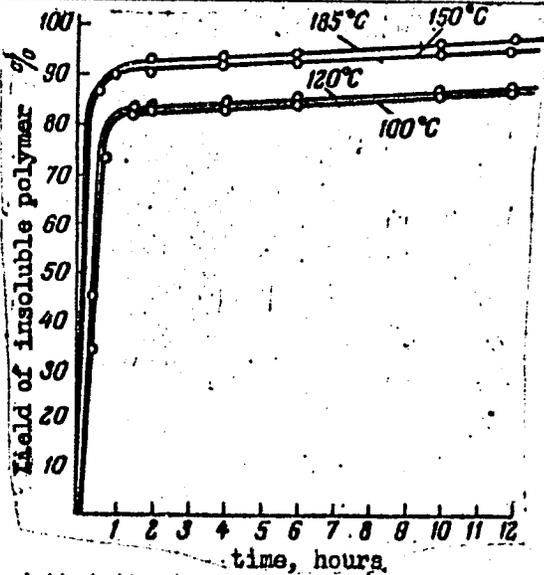

ABSTRACT: The chemical and physical properties of the polyesteracrylate-epoxide binding agent 1LED5M^b and the glass-textolite VPS-4 were studied. The investigation is an extension of work previously published by the authors (Plast. massy, 9, 1965). The change in viscosity during storage, the temperature dependence of the polymerization rate, and the tensile and compression strength of the binding agent 1LED5M were determined. Thermophysical properties of the glass-textolite VPS-4 prepared from nonoriented glass fibers and binding agent 1LED5M are presented and compared with those of glass-textolites St911S^b, VPS-2, and FN. The experimental data and comparisons are summarized in graphs and tables (see Fig. 1). It is concluded that the glass-textolite VPS-4 may be used up to a temperature of 200C. The impregnation method of textolite formation was found to yield textolites of higher compression strength.¹⁵

TITLE: Effect of technological and other factors on the properties of fiberglass 44.55, 15

SOURCE: Plasticheskiye massy, no. 9, 1965, 25-29

TOPIC TAGS: reinforced plastic, fiberglass, epoxy plastic, polyester plastic, filler

ABSTRACT: The paper discusses the effect of pressing conditions on the strength properties of glass reinforced plastics; this includes the type of polyester used for preparing the binder, the pressing temperature, heat treatment, pressure of pressing, and time spent in the press. The effect of sizing agents and emulsions used for preparing the glass braids is considered next. Other factors affecting the strength of the fiberglass-reinforced materials are the diameter of the fiberglass and the influence of mineral fillers. The corresponding findings for temperatures between 20 and 200C are tabulated. "The authors thank L.S. Krasnoyarskaya and Z. I. Bronshteyn for providing the materials for the study." TITLE: Basic physicommechanical properties of the fiber-glass plastic VP-1 obtained by method of "imbibing" chopped fiber glass

SOURCE: Plasticheskiye massy, no. 11, 1965, 43-45

TOPIC TAGS: polyester, epoxy plastic, glass fiber, fiber glass, solid mechanical property, structural plastic/ VP-1 fiber glass

ABSTRACT: It was the object of this investigation to extend previously published results on the influence of various types of polyesters in polyester-epoxy binders on the properties of the latter, and also on the effect of the manufacturing method of fiber-glass plastics on their properties, as given by the authors (Plast. massy, No. 9, 25, 1965). The strength, relative viscosity, Poisson coefficient, and the effect of various solvents on the fiber-glass plastic VP-1 were determined at various temperatures. The experimental results are tabulated. The plastic was prepared by pressing together glass fiber chips with
