TITLE: Long term memory device

SOURCE: Mekhanizatsiya i avtomatzatsiya upravleniya, no. 3, 1966, 23-26

TOPIC TAGS: computer memory, electronic amplifier

SUB CODE: CP

ABSTRACT: The Institute of Cybernetics of the Academy of Sciences of the Ukrainian SSR has developed a diode-transformer long term memory device with a capacity of 8,192 52-digit numbers. The device consists of an address decoder, 64 commutating switches and a numerical section plus 55 readout amplifiers. In order to increase the reliability of the memory unit, built-in control of the units which determine the address of a number cell is a feature. The memory volume is divided into three portions (built-in control on modulus 3). Components of the unit was tested using an experimental model with a capacity of 512 52-digit numbers. Primarily attention was given to the quantity and nature of the noises at the output of the cells. Inductive and capacitive noises did not exceed the signal level. Accessing frequency is 600 KHz.

TITLE: Semiautomatic system for sealing metal to glass in cathode-ray tubes.  
Class 21, No. 171947

SOURCE: Byulleten' izobretений i tovarnykh znakov, no. 12, 1965, 45

TOPIC TAGS: semiautomatic sealing system, cathode ray tube, cathode ray tube construction

ABSTRACT: An Author Certificate has been issued for a system for sealing metal to glass in cathode-ray tubes. To improve the efficiency of the system, eliminate intermediate furnace annealing, and maintain the desired temperature in the interval between the glass neck and metallic cone, the system is equipped with an electric heater. Title : Determination of Chromium in Leather with Complexon III.

Orig Pub: Kozarstvi, 1957, 7, N: 10, 283-284.

Abstract: In order to reduce the duration of analysis, a relatively simple, easy and rapid method of determination of chromium with Complexon III is recommended. This method is based on the formation of a colored chelate of chromium ions with Complexon III (disodium salt of ethylenediaminetetraacetic acid) in a weakly acid medium ( $\text{CH}_3\text{COOH}$ ). It was established that chromium contained

"Role of Filterable Forms in the Biology of Microorganisms," A. S. Kriviskiy

"Mikrobiologiya" Vol 21, No 5, pp 595-607

Reviews and discusses in some detail USSR work on filterable forms of microorganisms. States that the possibility of using filterable forms, which are flexible with regard to changes in inherited characteristics, puts a powerful tool into the hands of USSR microbiologists. Notes that regeneration of filterable forms will permit

229T51

Investigation of the formation of cells from noncellular matter. Holds that purely formal analogies between the phase (stage) development of higher plants and regeneration of bacteria from filterable forms should be rejected. Says that the hypothesis of phase development of microorganisms in the form in which it has been advanced by G. P. Kalina, V. A. Krestovnikova, and N. D. Utenskov cannot satisfy Soviet microbiologists.

Authors : Kriviskiy, A. S., Cand. Biol. Sci.

Title : Contagous diseases of man

Periodical : Priroda 43/4, 123-126, Apr 1954

Abstract : A review is made of the book, "Contagous Diseases of Man", by V. M. Zhdanov, State Publishing Office for Medicinal Literature, 1953, containing 255 pages. The book deals with the question of contagious diseases from the standpoint of their origin and evolution. Various infections are taken up separately and an attempt is made to discover what substances or organisms act as hosts when the microbes are not in the human body. The changes in toxicity in the microbes through evolution are discussed.

Title : New Data on the Biological Nature of Bacteriophage

Orig Pub: Sb. Bakteriofagiya. Tbilisi, Gruzmedgiz, 1957,  
35-45.

Abstract: A critical analysis of current concepts of the nature of bacteriophage. The data accumulated concerning the interrelation of phages with the host cell, their capacity of multiplication and changing their heredity depending on the living conditions, and their capacity for hybridization lead us to the belief that phages, like other viruses, represent

parasitic, pre-cellular forms of life which are exogenous with respect to the organisms affected by them and which have traversed a long road of evolutionary development in conjunction with bacteria. Data are presented on the successive stages of the reaction of phage with the cell. The biochemical aspect of this process is presented, particularly the role of phage DNA. The essence of the phenomenon of lysogenesis and the role of phages in the transduction process are clarified. The conclusion is drawn that the DNA of the phage enters into a very close association with the cellular systems regulating the metabolic processes and their hereditary changes. From this, a qualitatively new vital system, phage-

bacterium, arises with the same metabolism. This system acquires qualitatively new properties which are distinct from the properties of both of the components comprising it. The capacity of phages, like some other viruses, of including themselves completely in the structure of the host cell distinguishes them from other parasitic organisms and, in the author's opinion, reflects the extreme degree of specialization which occurs in the process of evolution of parasitism. -- Ya. T. Rautenshteyn.
