Title : Determining Lactose in Technical Lactose and Whey as Well as Determining Lactose and Saccharose in Condensed Milk with Sugar.

Orig Pub: Prace Inst. przem. mleczarsk., 1958, 5, No 1, 9-35.

Abstract: Determinations were made of lactose in whey and technical lactose, and in condensed milk with sugar, by the Bertrand, colorimetric with picric acid, colorimetric with anthrone, and polarometric methods. By statistical treatment of the results, it was established that the Bertrand method can be

Abstract: replaced only by the polarometric method, which gives sufficiently accurate results which do not appreciably differ. The colorimetric method with picric acid can be used for determination of lactose in products with a small concentration of it (whey), as well as in condensed milk with sugar, in view of the possibility of parallel determination of saccharose. The colorimetric method with anthrone is unsuitable for use in the laboratories of the milk industry. -- From the authors' resume.

4920. ASH OF UPPER SILESIAN COALS. PT III. ATTEMPTS IN
LABORATORY TO INCREASE CHARACTERISTIC TEMPERATURES OBTAINED ON FUSIBILITY
CURVES, Mielecki, T. and Krzyzanska, W. (Katowice: Prace Olgw. Inst.
Ogrn. (Proc. Chief. Inst. Min.), 1961, Komunik. 91, 7pp.). The chemical
compositions are given of ash, fines falling through grate, and slag, for
four Upper Silesian coals, and the relation between ash fusion temper-
ature and the ratio of $SiO_2 + Al_2O_3$ to Fe_2O_3 in ash. Means tried for
raising characteristic temperatures obtained in Dunte-Baum-Reerink appar-
atus were: (a) admixture of foreign substances to the coal, (b) elimination
of certain fractions and certain sizes, (c) extraction of some of the mineral
matter, and (d) blending of different types of coal. (L).

ABSTRACT	: Data on presented on the chemical composition of the ash (CA) in 219 samples of coals from the Glinicki District (Polish Peoples Republic), taken from three levels. On the basis of an analysis of these data, the possibility of the utilization of the CA as a characteristic index for groups of coal seams in which different sedimentation conditions prevailed, is indicated. The effect of the CA on the coking properties of the coal is also discussed, and the increased thickness of the
