Investigation of the spatial ...

v₁, the turbulent velocity (Ref. 10: Chernov, L. A., Rasprostraneniye voln v srede so sluchaynymi neodnorodnostyami - Wave propagation in a medium with incidental heterogeneities, Izd-vo AS SSSR, M., 1958). For a considerable number of experiments, the temporal correlation $q(\tau)$ may be written as $q = \exp(-\tau/a)$, where a has to be determined by experiment. An analogous expression holds for the spatial correlations $q(l)$. The authors point out the fact that, in the case of slow wind velocities $v < 1\text{m/sec}$ and enhanced refractions, the experimental curves are near those expected. When turbulence is great, not only the effect of regular drift but also that of chaotic motion in the atmosphere has to be taken into account in the formation of fluctuations. Investigations at the horizon showed that l_0 , for which $q(l_0) = 0.5$, always has the same order of magnitude. There are 6 figures and 10 references: 8 Soviet-bloc and 2 non-Soviet-bloc:

TITLE: Possibility of employing the phase-meter method in the investigation of field fluctuations of radio waves propagating in a turbulent medium

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiotekhnika, v. 4, no. 4, 1961, 425 - 431

TEXT: It is known that during propagation over routes near the ground the field at the receiver is determined by the average characteristics of the medium and the earth surface as well as their statistical characteristics (Ref. 2 - A.G. Arenberg - Propagation of decimetre and centimetre waves - izd-vo Sovetskoye radio, 1957). The presence of statistical processes leads to the amplitude- and phase-fluctuations of the waves and these fluctuations are random functions of time and space coordinates. It can be assumed for the purpose of analysis that at a point P of the space v the field (vector or scalar) can be expressed by:

Card 1/6

31904
S/142/61/004/004/005/018
E192/E382

Possibility of employing

$$\vec{E}(P, t) = \sum_m \vec{E}_m(P, t) = \sum_m E_m'(P, t) e^{i\varphi_m(P, t)}$$

where the sum extends over all the partial fields $E_m(P, t)$, which can be regarded as having arrived at the receiver along various trajectories; the field $\vec{E}(P, t)$ is therefore a result of multi-ray propagation. A two-antenna interferometer, shown in Fig. 1, is used as the receiver; it consists of: 1 - two antennae; 2 - feeder system and 3 - a square-detector. The voltage at the point C of the receiving system can be expressed by:

$$\vec{E}_c(\vec{r}, t) = \sum_m G_{1m}(t) E_m'(P_1, t) e^{i\varphi_m(P_1, t)} + \\ + \sum_m G_{2m}(t) E_m'(P_2, t) e^{i\varphi_m(P_2, t)}$$

Card 2/6

31954
S/142/61/004/004/005/018
E192/E382

Possibility of employing

where G_{1m} and G_{2m} are the gain coefficients of the two antennae,

$\varphi_m(P, t) = \varphi'_m(P, t) + \varphi_{mp}$, where φ'_m represents the mean value of the phase in the antenna aperture,

φ_{mp} is the fixed phase-shift during transmission of the signal from point P to point C of the feeder system.

The mathematical expectation $U_o(r)$ of the amplitude $U(r, t)$ of the output signal of the square-detector (see Fig. 1) is found analytically and this expression is employed to determine the conditions during propagation of ultrashort waves over near-ground routes extending over tens of kilometres. Under the assumption that the fluctuations are small two cases (important in practice) are investigated: 1) the field at the receiver has only one component ($m, n = 1$) and 2) the field consists of two components $E_o + E_s$, such that E_o has a constant phase and amplitude, while E_s is a random component. It is found that for

Card 3/

Possibility of employing

^{319th}
S/142/61/004/004/005/018
E192/E382

the first case the expectation $U_o(\vec{r})$ depends on the invariable field characteristics as well as the statistical characteristics of the medium. It is further shown that use of the phase-meter system accentuates the relative fluctuations of the output signal so that these can be measured and investigated comparatively easily. Secondly, the method makes possible measuring the space correlation characteristics of the field fluctuations. In the case of the field consisting of the two components E_o and E_s , use of the method permits elimination of the constant field component, which facilitates measurement of the field fluctuations. The problem was investigated experimentally and it was found that in the direct-visibility zone the amplitude-phase fluctuations of the ultrashort waves were so small that there existed practical difficulties in effecting the measurements. Thus, for example, during 65 measurement periods conducted between January and March, 1957, in 33 cases the relative fluctuation $\sigma_o^2 < 0.01$, in 20 cases $0.01 \leq \sigma_o^2 \leq 0.25$ and only in 12 cases $\sigma_o^2 > 0.25$.

Card 4/6

Possibility of employing

31984
S/142/61/004/004/005/018
E192/E382

A series of measurements of amplitude-phase fluctuations was carried out in the autumn of 1959 at ultrashort waves by the phase-meter method and it was found that the low-frequency component of the amplitude-phase fluctuations was primarily determined by the phase-fluctuations of the field; on the other hand, the fast component was due to the amplitude-fluctuations. This was further confirmed by some measurements of auto-correlation functions of the amplitude- and amplitude-phase fluctuations of the field at a frequency of $f = 9.550$ Mc/s. A preliminary estimate of the mean square phase-fluctuations shows it to be of the order of 10^{-2} radians, which compares with data available from the literature (Ref. 6 - A.V. Men', S.Ya. Braude and V.I. Gorbach - DAN SSSR, 1959, 125, no. 5, 1019; Ref. 7 - D.M. Vysokovskiy - Some problems of long-distance tropospheric propagation of ultrashort radio waves, pub. by AS USSR, 1958).

TITLE: Investigating space-time correlation relations at the level of a field of centimeter waves with propagation in a turbulent atmosphere

PERIODICAL: Radiotekhnika i elektronika, v. 6, no. 8, 1961,
1228 - 1236

TEXT: An account is given of an experimental investigation of the space-time correlation characteristics of intensity variations of a signal transmitted over a near-earth direct-visibility path of length 36 km. The experiments were conducted during the period June to December 1959. The transmitter was operated at 370 Mc/s in 1 - psec pulses with a repetition frequency of 577 pulses/sec. The parabolic transmitting antenna had a diameter of 0.7 m, giving a principal lobe with half-power points at about 3°. The radiation was horizontally polarized. The height of the transmitting antenna

Card 1/3

24882

Investigating space-time ...

was about 40 m above the earth's surface. Two superhet receivers were used, having a bandwidth of 4 Mc/s and a sensitivity of 70dbm. The receiving antennae were pyramidal, with a directional diagram about 15° in the H plane and 18° in the E plane. The base joining the two receivers was variable in length from 4 to 200 cm and was also variable as regards orientation. The height of the receiving antennae was about 4 m above the earth's surface. The outputs of the two receivers were applied simultaneously to an oscillograph type MIO-2 (MPO-2) and a record was obtained on film. The film speed was adjusted to 2 or 4 mm/sec depending on the character of the signal variations. Examples of film records are illustrated. The duration of recording for each base length was 3-4 min. The results of the statistical examination of the records are shown in tables and graphs. As regards the space correlation curves, the experimental results agree more closely with an exponential than with a Gaussian curve. Values found for the radius of correlation lie between 0.2 and 0.8 m, i.e. correlation as a rule disappears at a distance 0.7 to 25 λ, confirming the findings of A.A. Semenov

Card 2/3

D207/D304

and G.A. Karpeyev (Ref. 2: Vestn. Mosk. un-ta, 1957, 6, 69). Analysis of the time correlation curves clearly shows the influence of transverse wind speed. Three types of correlation curve are distinguished, viz., roughly exponential, roughly Gaussian, and rectilinear. Normalized space and time correlation functions are determined and estimates are obtained of radii of correlation. TITLE: Mechanical Properties of Mild Low-carbon Steel at Temperatures
Ranging From Room Temperature to 450°C (Mekhanicheskiye
svoystva myagkoy malougleredistoy stali v intervale temperatur
ot komnatnoy do 450°)

PERIODICAL: Tr. Mosk. in-ta khim. mashinostr., 1957, Vol 14, pp 31-54

ABSTRACT: Mechanical properties (σ_s , σ_b , S_k , δ , ψ ,
 τ_k , ϕ , and a_k) of steels St. 3 and of rimmed open-hearth
steels with standard and increased (up to 0.1%) As content
were investigated at temperatures ranging from 200°C to 500°C,
also steels containing 1.7% Mn. It was established that the σ_b
decreases, as the temperature is raised to 100°, increases
(up to 15%) as the temperature is increased from 100° to 300°,
and, finally, diminishes again. The level of potential energy
expended in the destruction of the specimen decreases at tem-
peratures up to 200°, increases as the temperature is increased
to 400°, and decreases again thereafter. It was confirmed by
means of the tests that heating of specimens which have been

Card 1/2

Mechanical Properties of Mild Low-carbon Steel (cont.)

preliminarily work-hardened to a temperature of 200°, with some subsequent exposure at that temperature, definitely determines a plateau of plastic flow upon the stress-strain diagrams; no such phenomenon was observed in the case of specimens which had been hardened by stretching, a fact which apparently is attributable to the anisotropy in properties of the metal that had been subjected to deformation in different directions. Notched specimens exhibited a σ_b which was 20% greater than that of smooth specimens.

TITLE: Perfecting a Machine for Hot Cyclic Tests of Metals under Conditions of Varying Plastic Deformation (Usovershenstvovaniye mashiny dlya goryachikh tsiklicheskikh ispytaniy metallov v usloviyakh peremennoy plasticheskoy deformatsii)

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, No. 1, pp. 101-102
(U.S.S.R.)

ABSTRACT: Reference is made to a device constructed in 1938 by L. T. Timoshuk for the study of the behavior of metals under conditions of varying plastic deformation with the surface of the metal in contact with a corrosive liquid medium and a temperature above 100° C. The heating and chemically active medium was a liquid of the sea water type. In the present study, tests with temperatures of 400-450° are made with a limited effect of the medium, quartz sand being used for heating instead of a liquid. A drawing is presented showing the principle of the heating device. Quartz sand is found to be superior to a liquid on account of the elimination of vaporization. There is one Slavic reference.

TITLE: Correction of interplanetary [✓]trajectories with the aid of impulses in the direction of a radial heliocentric velocity

SOURCE: Kosmicheskiye issledovaniya, v. 4, no. 5, 1966, 701-708

TOPIC TAGS: interplanetary flight, interplanetary trajectory, ~~something~~, heliocentric trajectory

ABSTRACT: The article is a study of multiple corrections of interplanetary trajectory by means of impulses in the direction of a radial heliocentric velocity ("solar" correction) under the assumption that the space vehicle moves along a non-perturbed Keplerian orbit. In this study, linear approximations are used and corrections are considered only on the heliocentric portion of the interplanetary trajectory, although, as it is pointed out, all results of the article can be extended to the correction of planetocentric trajectories. General properties of multiple corrections are analyzed. It is proved that the number of flight parameters to be corrected as well as the number of correcting impulses can not exceed four and the optimal number of impulses for correcting the vehicle coordinates in the picture plane can not exceed two. A system of equations is derived from which

Card 1/2

O

the magnitude of impulses ΔV_1 and ΔV_2 for correcting the coordinates η and ξ in the picture plane can be derived uniquely if the determinant of the system is not equal to zero. It is pointed out that the determinant of the system is distinct from zero for almost all interplanetary flight trajectories. However, the conditions which the optimal energy corrections of coordinates in the picture plane have to satisfy are derived. The question of the instant of carrying-out the second correction is analyzed for two connected (dependent) corrections. Orig. art. has 3 figures and 14 formulas..

Avtomatizatsiya teploenergeticheskikh ustanovok (Automation of Heat Power Installations) Moscow, Gosenergoizdat, 1960. 351 p. Errata slip inserted. 15,000 copies printed.

Ed.: P.N. Mamylov; Tech. Ed.: G. Ye. Larionov.

PURPOSE: This book is intended for students of heat power problems in polytechnic and power engineering schools of higher education. It may also be useful to heat power engineers dealing with automation of heat processes at electric power stations.

CONTENT: The book discusses the automation of heat power installations and the physical nature of automatic control. Fundamentals of automatic control and certain procedures of its engineering utilization are presented. Schematic circuits of the automation of basic assemblies and auxiliary equipment of heat power installations are discussed. Elements and structural features of the most widely used types of automatic regulators are described and analyzed.

KUBASSY, Laszlo, Dr; National Ambulance Service (chief director: OROVECZ, Bela, Dr), Ambulance Station of Miskolc (chief physician: KUBASSY, Laszlo, Dr) (Orszagos Menteszolgala, Miskolci Mentoallomas).

"The Development of Express Ambulances and Experiences with Its Use at the Ambulance Station of Miskolc."

Budapest, Honvedorvos, Vol XVIII, No 4, Oct-Dec 66, pages 259-264.

Abstract: [Author's Hungarian summary modified] The development of well equipped, express ambulance wagons by the domestic and foreign ambulance services is described. These wagons are equipped with highly specialized, intricate equipment to be used by a physician travelling with the ambulance to prevent or relieve shock and other severe traumatic conditions at the site of the accident. It is concluded that the quality of first aid which can be provided by the express ambulance has fulfilled the expectations in the Miskolc area as well, not only in traumatological but in other emergency cases too. The immediate treatment of accidents and the expansion of the express ambulance services is of decisive importance, especially in the provinces. More appropriate ambulance wagons and their operation from an ambulance-hospital base are recommended. All 24 references are Hungarian.

Fifteen patients with Hodgkin's disease, 5 with chronic lymphadenosis, 2 with reti-
culocytosis, 1 with atypical myeloma and 2 with inoperable carcinoma have been
treated with actinomycin C (sanamycin-Bayer). With the exception of Hodgkin's dis-
ease, the drug proved to be ineffective. In 15 patients with Hodgkin's disease, the
result may be considered as relatively good in 4 patients, not so good in 7 patients
and in 4 patients the therapy failed. The result obtained has not lasted longer than
for 6 weeks. Compared with the X-ray therapy and chemotherapeutics of the nitro-
gen mustard group, the results of the treatment with sanamycin are worse. Thus,
this drug cannot be considered to be a particular enriching of the therapeutical
arsenal in Hodgkin's disease and cannot be recommended for routine application.

"Liver Affection in Schistosoma Mansoni Infection."

Prague, Casopis Lekaru Ceskych, Vol 105, No 49-50, 9 Dec 66, pp 1352 - 1355

Abstract /Authors' English summary modified/: Bioptic liver specimens of patients infected with Schistosoma mansoni, or those where the infection was suspected were examined in 212 fresh samples and in 155 histological sections. Diffuse and permanent embolization of the ova into the liver is an integral part of the infection; the breakdown of eggs in the liver is relatively fast. Fresh hepatic tissue should be examined when ova are not found in faeces or by rectal biopsy. Histological examination reveals the extent of the damage. 12 Figures, 4 Czech, 3 Egyptian, 2 Japanese, 37 Western references.

EXCERPTA MEDICA Sec.12 Vol.10/9 Ophthalmology Sept56

1981. KUBAŠTOVÁ B. Oční Klin. PU, Olomouc. "Perforující poranění oka odtrženého v oční klinice v Olomouci od 1.1.1946 do 31.12.1954. Perforating injuries of the eye treated at the ophthalmological clinic of Olomouc from 1.1.1946 to 31.12.1954 ČSL.OP-THAL. 1956, 12/1 (33-38) Tables 9

325 patients with perforating eye injury were treated, mostly males (79.7%). Out of the total 30% were children up to 15 yr. of age. 60% of injuries occurred outside working-hours, 31.6% were industrial and 8.3% were agricultural injuries. 81.6% of cases came into hospital treatment within the first or second day. In 44% of cases there was a perforating injury with intraocular foreign body out of which 41.9% were non-magnetic. In 48.9% of cases extraction by magnet was performed, 40.6% got conservative treatment only, in 20.8% Kuhnt's plastic operation and in 9.8% Kuhnt's operation together with suture were performed. Primary suture of the wound was performed in 23% of cases. Excision of the eye was necessary in 13.5%, amaurosis resulted in 3%, light perception in 8.3% visual acuity better than 6/12 in 21.8% of patients. The therapeutic results do not differ from statements in the literature.

TITLE: Special-quality tubes made by TESLA

PERIODICAL: Sdělovací technika, no. 7, 1962, 254 - 257

TEXT: TESLA Rožnov, Czechoslovakia, produces the following high-quality (trustworthy) tubes, type: E88CC, E180F, ECC802S, ECC803S, EF800, EF806S and EL803S. These tubes, apart from E180F, have equivalents in the normal-production tubes but they differ from the standard types by closer electrical tolerances, lower maximum loads and a guaranteed life of 5 000 hours. The tubes are also equivalent to those of similar designation made by foreign manufacturers (Valvo, Telefunken and Phillips). There are 2 figures and 4 tables.

TITLE: Fume removal from electric arc furnaces

SOURCE: Hutnické listy, no. 2, 1966, 93-97

TOPIC TAGS: arc furnace, gas filter, metallurgic machinery, metallurgic process, gas engineering

ABSTRACT: The basic principles of the problem are described. The methods for the removal of waste gases, the selection of a filtration station for these gases, the temperature and the combustion properties of these gases are discussed. Methods for additional combustion of ingredients of such gases are described; cooling of such gases, and a heat accumulator are discussed. Suitable furnace pressures are evaluated. Differences between the usual Czechoslovak processes, and the technological aspects of foreign processes are discussed. Orig. art. has: 5 figures.
