AUTHORS: Kugler, Tibor and Miklóssy, Konstantin, Engineers

TITLE: Research in the Field of Technological Utilisation
of Plasma

PERIODICAL: Elektrotechnicky obzor, 1960, Vol. 49, No. 3,
pp. 153 - 158

TEXT: In the first part the authors give a very brief survey of information published in the literature on this subject, referring particularly to work of Burhorn, Maecker and Peters (Ref. 16 - Zeitschrift für Physik, 1951, p. 369; Ref. 17 - ditto-, p. 28) and an article of J. Maecker (Ref. 14 - ditto-, p. 198) and R. Weiss (Ref. 12 - ditto-, 1954, pp. 170 - 182). The authors started work on the subject in 1954. Their aim was to solve the problem of producing a plasma torch with liquid cooling and an electrode of a diameter substantially larger than the diameter of the outlet channel. The authors carried out a detailed study of various phenomena occurring in the burning arc, particularly of the shape of the surface and the conditions under which this shape can be kept

Card 1/5

constant. The authors are not aware of experimental data published on this question and theoretical assumptions proved incorrect. The difficulty of solving this problem has prevented extensive use of liquid-cooled plasma torches with graphite electrodes of diameters larger than the outlet nozzle. As regards the shape of the channel formed in the liquid used for cooling the gas plasma, Burhorn, Maecker and Peters assumed that whilst the arc burned in the channel a pressure arose which varied continuously and deformed the channel so that it became barrel-shaped; at the outlet aperture of the plasma torch the pressure equalled that of the ambient atmosphere. They also assumed that the pressure in the water-delivery pipe was not affected by the change in the pressure on the liquid-gas boundary. These assumptions were based solely on measuring the electrical characteristics at high current densities, which revealed a change in the gradient corresponding to the change in the channel diameter. Above a certain current intensity the increasing volt-ampere characteristic of the arc changed into an independent one so that a supply source with a decreasing

Research in the Field of

characteristic is required to feed the plasma. The authors determined the shape of the water-gas boundary by X-ray photography and they also measured the pressure in the water-delivery pipe. They found that, contrary to expectations, the pressure in the pipe did change with the current intensity and that the shape of the channel was different from that determined theoretically by Burhorn, Maecker and Peters. The measurements have shown that during burning of the arc the surface of the channel expands but remains coaxial with the original surface for about two-thirds of the channel length. Then follows a short intermediate section, in which the channel narrows down and this section is succeeded by a section at the outlet where the surface of the channel has the same diameter as it had when the arc was not burning. The results are explained by the assumption that burning of the arc produces a mass flow nozzle with a variable temperature in the channel of the plasma torch and evaporating liquid walls. In the plasma torch built by the authors, the arc is produced between a graphite electrode located inside the plasma torch and an

Z/017/60/049/003/004/004
E073/E335

electrode located outside the main channel, in a channel with a diameter of about one-half to two-thirds of the electrode diameter. The channel is subdivided into two parts, the rear part being larger so that electrodes of a larger diameter can be used. The authors have used this torch for experiments in flame-cutting of high-alloy steels, copper and aluminum, i.e. materials which are difficult or impossible to cut with an oxyacetylene flame. For a voltage of 180 V and currents of up to 300 A an 8-mm wide cut can be produced in material up to 35 mm thick at a rate of 60 cm/min. It was found in experiments with flame-cutting that, compared with cutting with a tungsten electrode using an argon atmosphere, a saving of about 1 m³ of argon per hour is achieved, the electric-power consumption remaining approximately the same. It is estimated that the rate of energy transfer from² the plasma to the material is of the order of 4 to 5 kW/cm². Very

Title : The Problem of a Hydrolysis Study of Aluminum
Alcoholates.

Orig Pub: Chem. prumysl, 1957, 7, No 10, 564-566.

Abstract: The mechanism of the hydrolysis reaction of secondary Al butanolate when the Al:H₂O ratio is 2:1 - 1:1. The hydrolysis was conducted at a temperature from -50 to -55°C in the absence of an air humidity. In the author's opinion in a hydrolysis with an insufficient amount of water the primary reaction is the formation of Al hydroxyalcoholates which at 150°C are condensed with

ABS. JOUR. : RZhKhim., No. 1959, No. 889/86
AUTHOR : Kugler, V.
INST. :
TITLE : Formation of Aluminum Resins on Hydrolysis
of Complex-Forming Aluminum Alcohohlates
ORIG. PUB. : Chem. prumysl, 1959, 9, No 2, 97-101

ABSTRACT : Study of the synthesis of aluminum resins formed on hydrolysis of the intermediate product resulting from the interaction of 1 mole of Al-ethanolate with 1 mole of ethyl ester of acetoacetic acid, at elevated temperature. It was ascertained that it is primarily the ethoxy-groups that interact with H₂O; the acetoacetic groups remain unchanged up to the temperature of decomposition of monomers (180-190°). The course of polymerization and the nature of the resultant products depend on the ratio between Al (that is present in the molecule of the intermediate product) and the amount of H₂O added for hydrolysis. The polymer that is formed consists of molecular chains of different size which can also form a three-dimensional network. The chain skeleton is formed by Al and O-atoms.

TITLE: A new substance improving aluminum-base heat-resistant coatings. CZ Pat.
No. PV 4368-63, Class 22g

SOURCE: Vynalezy, no. 11, 1965, 14

TOPIC TAGS: aluminum compound, heat resistant material, pigment

ABSTRACT: Author Certificate has been issued for a coating substance that improves the protective properties of heat-resistant coatings. The substance is made of an aluminum-powder pigment, and aluminum resin or chelates as a binder, in which a thermally stable inorganic pigment is homogeneously dispersed. This pigment may range from 30 to 65 (wt %) of the aluminum oxide formed by the heat treatment. The pigment is surface treated by using 1 -- 8-wt % aliphatic acid or C₁₂ up to C₁₈ acids.

SOURCE: Vestnik protivovozdushnoy oborony, no. 10, 1966, 64-68

TOPIC TAGS: digital computer, digital system, antiaircraft defense, military communication, alphanumeric display, AIR DEFENSE SYSTEM

ABSTRACT: An alphanumeric display is used in the air-defense system for the high-speed collection and simulation of important data on military positions, action taken by the air-defense forces, meteorological conditions, and air-defense-force readiness. The alphanumeric display operates on a cold-cathode thyratron, which simplifies the device, decreases its cost, decreases the amount of electricity used, and assures operational reliability; if necessary, the cold cathode thyratron can replace the electron tubes and semiconductor devices which are favored for military use. The system works on the electroluminoflavin principle. Orig. art. has: 7 figures and 1 table.

TITLE: Nuclear magnetic resonance study of the keto-enol equilibrium of 3-alkylacetones

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 9, 1965, 1556-1564

TOPIC TAGS: NMR spectroscopy, ketone, NMR

ABSTRACT: NMR spectra of the following compounds were studied: 3-methyl-, 3-ethyl-,
3-n-propyl-, 3-isobutyl-, 3-isopropyl-, and 3-sec-butylacetyleacetone, and also 2-isopro-
poxy-2-penten-4-one. The spectra were taken with a JNM-3 instrument (40 Mc) and some
were also recorded with an RS-2 spectrometer (60 Mc) at ~ 25°C, and the content of enol
forms was determined. Alkylacetyleacetones with unbranched substituents were shown to
contain cis-enol forms at equilibrium with the ketone; this agrees with chemical data.
Compounds with branched substituents (3-isopropylacetyleacetone and 3-sec-butylacetyle-

TITLE: Increased Utilization of Long-Distance Telephone Channels
(Povysheniye effektivnosti ispol'zovaniya telefonnykh kanalov dal'ney svyazii)

PERIODICAL: Vestn. Vses. n.-i. in-ta zh.-d. transporta, 1956, Nr 2, pp 51-54

ABSTRACT: Investigations conducted by Vsesoyuznyy nauchno-issledovatel'skiy institute zheleznodorozhnoy transporta (All-Union Scientific-Research Institute of Railroad Transportation) have established that the frequency band within existing carrier channels is insufficiently used in telephone communications. The bands 200-400 cps and 1,800-2,800 cps in telephone channels remain, as a rule, unused because of the low sensitivity of existing telephone sets and because of band-filter imperfections in the carrier equipment. New equipment for channel division has been developed; it is designed to double existing telephone channels that are formed by carrier systems with separate carrier-

Card 1/2

SOV/112-57-5-109 38

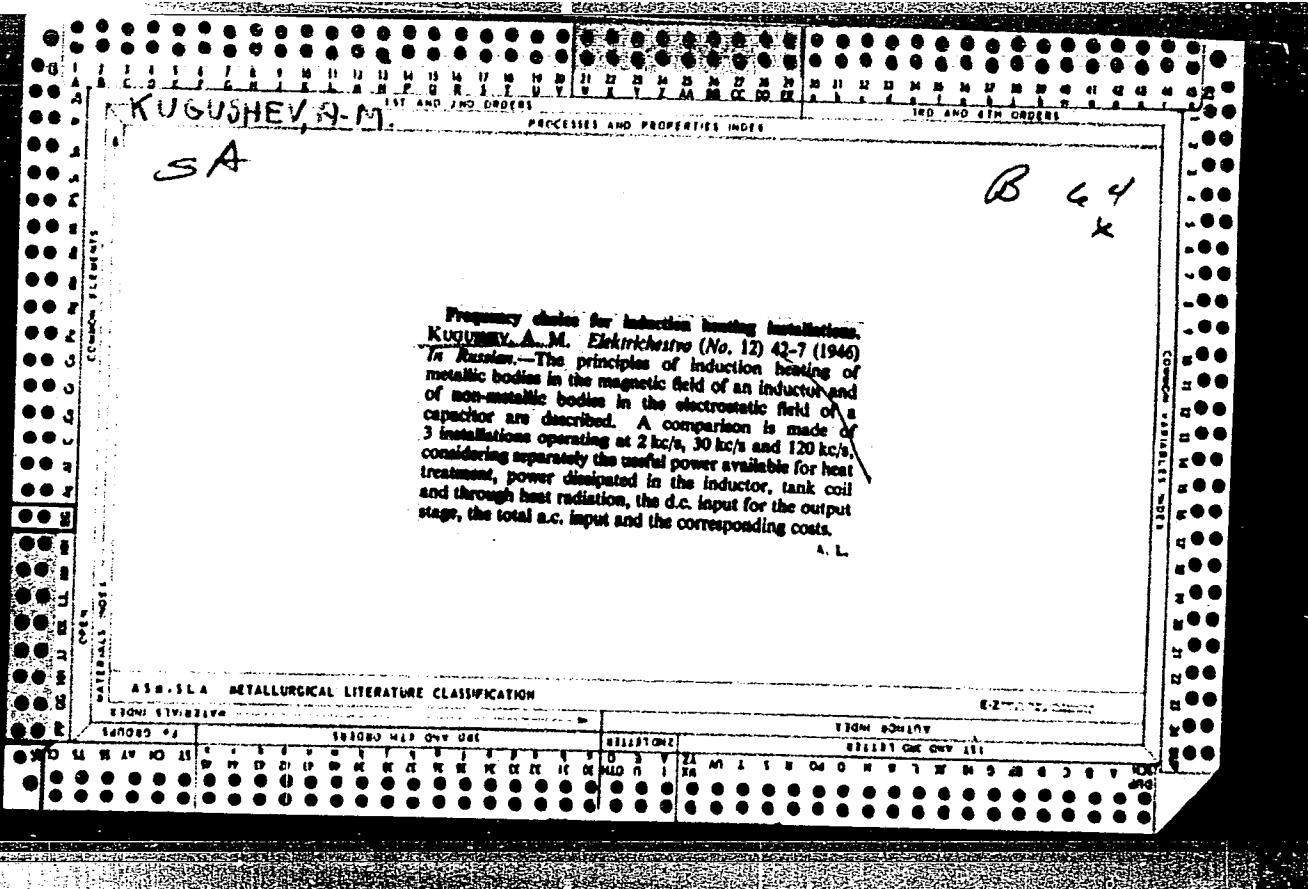

Increased Utilization of Long-Distance Telephone Channels

frequency oscillators. The devices intended to form the fundamental and additional narrow-band channels are connected, at the terminals, to the carrier channels by a four-wire circuit; in addition to band-dividing filters, they have transmitting and receiving amplifiers intended to compensate for the overall-carrier circuit attenuation. To increase intelligibility and to gain the natural character of speech, carrier-restoration channels are connected, at the receiving station, in parallel with the input and output of the receiving amplifier of the narrow-band channel. Each restoration channel comprises two amplifiers, a frequency converter, and a band filter. As a result, the new equipment permits securing an entirely satisfactory transmission of two telephone conversations through channels formed by a carrier system with individual carrier-frequency oscillators. Operating tests have shown entirely satisfactory results. Estimates have demonstrated that the above method of increasing the number of communication channels is more economical than other methods.

TITLE: [Transactions of the] Conference on the Occasion of the 40th Anniversary of the Nizhniy-Novgorod Radio Laboratory imeni V.I. Lenin (Konferentsiya, posvyashchennaya sorokaletiyu Nizhegorodskoy radiolaboratorii imeni V.I. Lenina)

PERIODICAL: Radiotekhnika, 1958, Vol. 13, Nr 8, pp. 71-79 (USSR)

ABSTRACT: From May 22-24, a conference took place at Gorkiy which had been organized by the Gor'kiy Branch of the Scientific and Technical Society for Radio Engineering and Electric Telecommunication Service imeni A. S. Popov. The conference was attended by: B. A. Ostroumov, A. M. Kugushev, A. A. Pistol'kors, N. A. Nikitin, G. A. Ostroumov, V. P. Yakovlev, V. K. Ge, N. N. Pal'mov, F. A. Lbov, A. S. Nikolayenko, I. P. Kotterov, S. I. Morugina, Ye. S. Sorokin et al. as well as by a group of former collaborators of the Tver' radiostation. A. M. Kugushev spoke about "The Nizhniy-Novgorod Radio Laboratory imeni V. I. Lenin, L. A. Kopytin on the development of the technique in radio engineering, the establishment of radio communication facilities and television apparatus. A. I. Shokin spoke about the development of the Soviet radio-engineering industry during the past 40

Kugushev, Aleksey MikhaylovichRadioelektronika (Radio Electronics). Moscow, Fizmatgiz, 1959.
59 p. 25,000 copies printed.

Ed.: T. V. Mikhalkovich; Tech. Ed.: Ye. A. Yermakova.

PURPOSE: This booklet is intended for students of schools of higher education, radio amateurs, and members of secondary school physics clubs.

COVERAGE: The booklet deals with radar, radio telescopes, radio-meters, molecular amplifiers and oscillators, semiconductor and ultra-high-frequency devices, new types of radio phonographs, electronic counters, automatic devices, etc. No personalities are mentioned. There are no references.

TITLE:

Radioelectronics (Radioelektronika). In Commemoration of the
100th Anniversary of the Birthday of A. S. Popov (Posvyashchayet-
sya 100-letiyu so dnya rozhdeniya A. S. Popova)

PERIODICAL:

Uspekhi fizicheskikh nauk, 1959, Vol 67, Nr 4, pp 663-703 (USSR)

ABSTRACT:

On the occasion of the 100th anniversary (March 16, 1959) of
the birthday of Aleksandr Stepanovich Popov (1859-1906),
who played an essential part in the development of wireless
telegraphy, the author of the present paper gives a very
detailed description of the basic experiments and investiga-
tions carried out by Popov (figures show wiring diagrams of
Popov's radiotransmitter and -receiver) as well as a survey
of radioengineering and its practical application at the be-
ginning of the century, in which connection he mentions
L. I. Mandel'shtam (1879-1944) and M. A. Bonch-Bruyevich
(1888-1940) as well as a number of other Russian radioengineers
who have already died. The main part of the paper is, however,
devoted to the later development of radioengineering. On the
basis of numerous examples and figures, the development of
tubes, of the technique of transmission, and of transmitting

SOV/53-67-4-4/7

stations up to ultrashort wave transmission is discussed. Furthermore, the physical bases and the mathematical methods of modern radioengineering, the development of which was to a considerable extent due to Mandel'shtam, Papaleksi (1880-1947) and Yu. B. Kobzarev are mentioned. A special chapter deals with the radiation, propagation and directioning of radiowaves in modern radioengineering, special account being taken of ultrashort waves. A very detailed account is also given of the production and amplification of electric oscillations in modern radioengineering. The last chapter deals with the application of modern radioelectronics in practice; ultrashort wave radiotelegraphy, radiolocation in the decimeter-, centimeter-, and millimeter-ranges (up to distances of several 1000 km), the investigation of the radiation of celestial bodies by means of ultrashort wave receivers and directional antennae is discussed (thus the moon "transmits" in the 8.6 - 12 mm band and Mars in the 30 mm band). Intense radiosignals originating from Jupiter and lasting several seconds were recorded in the 18-20 megacycle band; the intensity of these radio-pulses emitted from several sources on Jupiter was 100,000 times greater than the powerful lightning discharges in the terrestrial

SOV/53-67-4-4/7

atmosphere; also from the galaxy and from interstellar clouds of gas radiated signals were received; even the Sputnik and the first cosmic rocket of the USSR recorded important data for radioastronomy. Radioelectronic apparatus are today being used also in nuclear physics and -engineering, e.g. for the recording of the radiation of "tagged" atoms; by using high-frequency electromagnetic fields accelerator plants were built, the efficiency of which is continuously being increased. Thus, the USSR possesses a 10^9 ev synchro-phasotron (magnet diameter 60 m, power 150,000 kw), and now an even larger one with $5 \cdot 10^{10}$ ev, which will have a particle orbit of 1.5 km, is under construction. Further, work is being carried out with a view of transforming thermal energy into electric energy by using the emission of thermal ions; also electronics plays an essential part in the realization of thermonuclear reactions and it is being used in an ever-increasing degree for military tasks (electronic control, automation) and further also for the rapid computation of complicated problems by electronic computers (the efficiency and applicability of which are discussed in detail). Today

there is hardly a field to which electronics is not applied,
existing possibilities continue to be extended; apparatus
are being improved, and new inventions are made. There are
28 figures and 130 references, 53 of which are Soviet.

AUTHOR: Kurgushev, A., Professor, Doctor of Technical Sciences

TITLE: Cosmic Radioelectronics

PERIODICAL: Radio, 1960, No. 11, pp. 9 - 12

TEXT: The author defines as "cosmic radioelectronics" the study and the development of various apparatus and equipment for radio-astronomy and radiolocation of celestial bodies, artificial satellites and space rockets and also for improvement of superlong-distance radio communication and radio navigation on the ground with the aid of artificial satellites; it includes problems relating to ionic and photon rockets and also the utilisation of powerful electromagnetic fields for wireless power transmission. Referring to the use of satellites for retransmission of television programmes it is mentioned that a "stationary" satellite located at an altitude of 36 000 km would require a transmitter of only 1 kW and aerials of only 10 m² on the ground and a transmitter of a few W and an aerial of the order of 1 m²

on the satellite. The Moon could be used for this purpose and it can be assumed that in the non-too-distant future it will be possible to land on the Moon automatic radio-relaying equipment which would be sufficiently powerful for maintaining international telecommunications and for navigation purposes. For passive retransmission the satellite would have to be of excessively large dimensions and the ground transmission station would also have to be excessively large. The Moon cannot be used for passive retransmission except for telegraphic or simple telephone signals; due to its large dimensions the signal would be distorted to such an extent that it would be intolerable for television transmission. Great progress has been achieved in radio guidance. The second Soviet satellite-space ship landed in the target area at only 10 km from the planned target point, after having travelled 700 000 km. Further improvement of space television apparatus will enable transmitting to the ground information not only on macroscopic but also on microscopic processes

Cosmic Radioelectronics

and it is likely that it may not be necessary to bring back to Earth such material as nuclear photo-emulsions, biochemical specimens, etc. In radio-control of a rocket the coordinates, speed and acceleration, are determined by radar or radio-direction finding ground stations. On the basis of the determined values fast computers generate command signals which are continuously transmitted to the rocket. On the initial section of its trajectory the rocket can also have non-interacting control from a programme equipment. In such a system the appropriate control signals are fed to the propulsion unit and deviations in direction and speed are recorded by means of gyroscopes; the resulting error signals are transformed by electronic equipment into appropriate control signals. At great distances from the ground the flight of the rocket can be guided by means of homing radar which starts operation on the final section of the trajectory and guides the rocket into the desired orbit around the particular celestial body. Guidance of the rocket into an orbit can also

Cosmic Radioelectronics

be materialised by means of radio telecontrol from the ground. In the same way, the return of the rocket from a given orbit and flight back to Earth could be materialised, provided that the rocket is designed for this purpose. The accuracy of the radio guidance is based on the extremely high accuracy of measuring time. At present, it is possible to measure time in terms of fractions of a billionth of a second and atomic or molecular clocks have an accuracy of 1 sec over a period of 3 000 to 4 000 years. One of the main problems of radio equipment on satellites is the problem of size and weight. Developments in the field of semiconductors and atomic physics have progressed to such an extent that it is now possible to transform a small piece of semiconductor material into an amplifier that does not require an external power source. Miniature radio-receivers have been built - the size of a lump of sugar. The amplifiers in these are as big as a match head and over 1 000 components are crammed into a

Cosmic Radioelectronics

volume of 1 cm³. Reliable communications with satellites at distances of tens and even hundreds of thousands of km can be maintained with a transmitter of 10 to 100 W. However, for maintaining radio-communication and radiocontrol of space rockets within the solar system, ground transmitters of several thousand kW and very sensitive receivers are required; the sensitivity of the receivers has to be millions of times higher than that of the best commercial television receivers. The present state of development is such that this can be achieved. Increase of the range of radio-communication can be achieved by slowing down the speed of transmission. If the speed of transmission is slowed down 100 times, the range of communication can be made 10 times higher using a transmitter of the same power and the same aerial system. The increase in range to be gained by slowing down the transmission speed is evident from the following table:

TITLE: Diagrams for the Determination of the Harmonic Composition of the Magnetization Current When Superimposing a Constant Field on an Alternating Field (Grafiki dlya opredeleniya garmonicheskogo sostava namagnichivayushchego toka pri nalozhenii postoyannogo polya na peremennoye)

PERIODICAL: Elektrичество, 1959, Nr 7, pp 55 - 57 (USSR)

ABSTRACT: The investigation of the harmonic composition of the magnetization current when superimposing a constant field with a frequency of 50 cycles upon an alternating field was carried out in connection with the providing of new controlled static devices for the transversal compensation of alternating current transmission lines. For this work the principle of magnetic amplification was used. Experiments were carried out for the purpose of magnetizing the large power transformers in the Mosenergo-system (at the power plant GES-13 in 1954 and at the 400 kv substation in 1956). When superimposing a constant field upon an alternating field also small samples of electrotechnical steels were investigated (Ref 1). The characteristic feature of these investigations was the fact that
