tekhn. inform., 1961, 35-36.

TEXT: A probe for the ultrasonic flaw detection of butt- and fillet welds, which ensures constancy of the traversing time of an ultrasonic pulse into the probe head and of the distance from the radiation center to the front face of the probe. Whilst the entry angle of the ultrasonic beam into the tested material is varied continuously and automatically, the above quantities remain constant. This is achieved as follows: the ultrasonic radiation source with a concave radiation-emitting surface which ensures the focusing of the ultrasonic rays, is fixed onto a flap which is rocked by a cam mechanism. The flap pivot is made to coincide with the bottom of the probe body in such a way that, for any position of the radiation source, its focus passes through the flap pivot.

Card 1/4

Probe for an ultrasonic flaw detector

S/887/61/000/009/024/069  
E073/E183

The cam profile is chosen to ensure a uniform rate of beam entry angle variation. The probe (Fig. 28) consists of a body made of "perspex" (transparent acrylic plastic) filled with a liquid in which the ultrasound propagates. Inside the body a piezoelectric emitter is mounted on the pivoted flap. The focus of the concave plate of the piezoelectric emitter coincides with the axis of the pivoted flap. The rocking movement of the pivoted flap, actuated by the cam mechanism, leads to a continuous automatic variation of the entry angle of the ultrasonic beam. The mechanism with the special profile cam maintains the following condition:

$$\frac{da}{dt} = \frac{d}{dt} \arcsin \left( \frac{C_m}{C_f} \sin \beta \right) = \text{const.}$$

where:  $\alpha$  - entry angle of the beam into the tested material;  
 $\beta$  - angle of incidence of the ultrasonic beam;  $C_m$  - velocity of ultrasound in the tested material;  $C_f$  - velocity of ultrasound in the liquid which fills the probe body;  $t$  - time of passage of the ultrasonic pulse. Maintenance of this condition ensures the fulfilment of the necessary variation of the angle of incidence  $\beta$ .

AUTHOR: Kukli, A. S. (Engineer)

TITLE: New ultrasound flaw detectors of the UZD-NUM-5 type

svarochnoye proizvodstvo, no. 2, 1965, 35-36

TOPIC TAGS: flawmeter, portable flawmeter, direct reading flawmeter, weld seam, flaw detector

ABSTRACT: The article briefly describes three new ultrasonic flaw detectors. The oscilloscope was developed at the All-Union Scientific Research Institute No. 10 for the discovery of internal flaws (flawmeter). The flawmeter is used for determining the presence of defects with a depth of 10-15 mm in the first two layers of the weld seam.

Test by-layer study of weld seam. During the fall of 1964 carried the work of the All-Union Scientific Research Institute No. 10 in Moscow. The test showed that the flawmeter can detect flaws in the first two layers of the weld seam. The main problem in the development of the flawmeter is the development of a

operates at 2.5 Mc, weighs 8 kg, and is 280x240x180 mm in size. It connects to the 220 v.

TITLE: Radioactive decay of Re<sup>188</sup>

SOURCE: Chekhoslovatskiy fizicheskiy zhurnal, v. 15, no. 11, 1965,  
824-831

TOPIC TAGS: radioactive decay, radiation spectrum, photoelectron,  
conversion electron spectrum, electron structure, nuclear radiation  
spectrometer, radioisotope, rhenium, gamma transition

ABSTRACT: The spectra of neg tons, conversion electrons, and photoelectrons have been measured with the iron-collar double-focusing spectrometer. Two  $\beta$ -groups with end-point energies of 2128 and 1973 keV and lgft values of 8.04 and 8.41 were observed. The K and L conversion coefficients of the 155.0-keV transition were found to be nearly in agreement with theory. Three new  $\gamma$ -transitions, 635, 1175, and 1461 keV were observed, and some corrections of the decay scheme were made. The possible interpretation of the excited states are discussed. The partial results of this paper were presented at the Annual Nuclear Spectroscopy Conference, Dubna, June 1964. At this conference,

Card 1/2

L 22376-66

ACC NR: AP6009366

the authors were told about the work on the same isotope done by the Soviet group. Because this information was incomplete, it was not included in the list of references. A paper has since been published (V. D. Vitman, N. A. Vionova, B. S. Dzhelepov, *Yadernaya fizika*, 1, 1965, 191). Besides the three new  $\gamma$ -transitions observed in the present paper, the seven additional  $\gamma$ -transitions are reported, and several energies in the two papers in question are slightly different. The authors thank M. Burianek, V. Kopriva, and F. Prazak for their assistance in this work. Orig. art. has: 7 figures and 2 tables.

ABSTRACT: The article is an abstract of the author's report No 1, dated 28 Feb 65, forming a part of Research Contract No 45-63-338/I. The article is published in Czech and in English. The control circuit for the gas flow in the first Czech nuclear power station A1 is discussed. A computer program was worked out, and it is expected that a model will be erected to be controlled by a computer in the evaluation of the circuit. The information will be used for start-up operation of the full-size control circuit. [Orig. art. in Eng.] [JFRS]

Nuclear reactor simulator

lator are given. In the first design the reactivity is given in the form of resistance values. In the second design, based on deviation determination, reactivity is presented in voltage form. In the second design an electronic multiplier has to be added. For solving the problems of nuclear power station, besides the dynamics of the reactor, the dynamics of the other installations and circuits are of importance. The primary and the secondary circuits of the power plant can be modelled and solved on a differential analyzer. There are 7 figures and 2 tables.

TITLE: Three way control valve. Class 46, No. 184066 [announced by the Smolensk branch of Scientific Research Institute of Heat and Power Instrument Construction (Smolenskiy Filial Nauchno-issledovatel'skogo instituta teploenergeticheskogo priborostroyeniya)]

SOURCE: Izobret prom obraz tov zn, no. 14, 1966, 122-123

TOPIC TAGS: control valve, three way control valve, flow distribution, three way valve, valve

ABSTRACT: The proposed three-way control valve for the proportional distribution of a flow or for mixing two flows with different temperature gradients has a locking element consisting of four sealing edges, interacting with the corresponding fitting bands of the casing seats (see Fig. 1). In order to compensate for the static and dynamic unbalance of the locking element, the latter is made in a form of a hollow cylinder with two bands, joined together by the contour profile of the sealing edges: openings for the main

KOS3. Carrying out of surge tests, particularly on  
transformers. M. KONKA, J. KOPCEK AND V.

SOKOL

In Czech

After describing the various methods of fault detection during surge tests, the investigation of the applicability of the methods for various operating conditions, the results obtained by oscillographic detection methods are compared on the basis of published data, no special tests being made for this purpose. These tests were performed on a 220 kV A.

220/110/11 kV transformer with an aluminium winding, a 10 MVA, 71.8/11 kV autotransformer and a 25 MVA, 100/23/6.3 kV transformer with tap-changing under load; in the test the methods of current measurement in the neutral point, one other phase and the current flowing from the tank were applied. Experience gained in surge tests developed for 220 kV transformers now being manufactured in Czechoslovakia is also described and information is given on the oscillograph, surge generator and pick-up circuits used.

TITLE: A Method for Investigating and Evaluating the Data From  
Electrical Recording the Wind Wave Disturbance

vv v

PERIODICAL: Tr. Vost.-Sib. fil. AS USSR, 1958, Nr 8, pp 115 - 132

ABSTRACT: The author describes an electric onograph, the function of  
which is based on the electrical conductivity of fresh water.  
The device was examined on the Lake Baikal in 1953 - 1954.  
The appliance comprise: An electric bridge with a wave meter  
staff and with supply leaders; a generator feeding the bridge  
circuit; an alternating-current amplifier, a rectifier, a  
recording gear (galvanometer oscillograph), and a time marker.  
The maximum recorded height of the waves depends merely on the  
length of the winding of the onometer staff. The resistance  
of the staff winding is one of the arms of an out-of-balance  
bridge of alternating current. The current intensity depends  
on the height of the wave. The amplification of the signal ✓

Card 1/2

SOV/169-59-7-6896

A Method for Investigating and Evaluating the Data From Electrical Recording  
the Wind Wave Disturbance

power is performed by the amplifier. The constant component is singled out by the rectifier having a capacitance filter. The design, the functioning, and the calibration of the device are described. The measuring accuracy is limited by  $\pm 2.5$  cm. The method of evaluating the measurements is briefly described: the method of the horizontal sections is proposed. Data on the frequency of the wave levels and a graph of the frequency of the wave levels and the wave heights are added. The rectilinearity of the characteristic of the electric ondograph facilitates the evaluation of the oscillograms, permits the transition to true-to-scale recording of waves, and guarantees the scale control by the marks of the control sections. The following values can be recorded simultaneously: the wind velocity and the profiles of the wave undulation, the near-bottom pressures, and the dynamical shocks of waves against the constructions. When applying a relay, the recording proceeds automatically.

TITLE: A radio-measuring unit of columnated waves. Class 42, No. 173431

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 15, 1965, 88

TOPIC TAGS: wave analyzer, measuring instrument, radio transmitter, wind meter

ABSTRACT: This Author Certificate presents a measuring unit with a radio transmitter for measuring water waves columnated by height. The unit contains an electric contact pick-up, pulse unit, wind speed gauge, and automatic unit for switching on the measuring unit, a flashing light, a radio transmitter, and a power source (see Fig. 1). To reduce the effect of the secondary waves in the basic disturbance system on the result of the processed information, an intermittent selector is connected in series with the pulse unit. To increase the useful life of the electric power source, the automatic unit for switching on the measuring unit is an electrode, connected in series with an electric contact clock, mounted on the measuring unit at a given elevation above the static water level.

TOPIC TAGS: microelectronic thin film, polymer physical property, polyvinyl alcohol

ABSTRACT: The properties of films made from polyvinyl alcohol filled with colloidal graphite have been studied. The resistivity of these films is minimal when the graphite content is 70%. The degree of intumescence, tearing strength, and elongation monotonously decrease while relative viscosity increases, when the graphite content increases. Introduction of a plasticizer (glycerin) tends to increase the film resistivity. The extremal dependence of the electric conductivity on the degree of fill and the concentration of source solution is connected with structural changes in the graphite lattice distributed in the polymer. TITLE: Ocean current variability and its relation to atmospheric processes

SOURCE: Moscow. Tsentral'nyy institut prognozov. Trudy, no. 142, 1965. Morskiy prognozy i raschety (Marine forecasts and calculations); materialy Vsesoyuznogo soveshchaniya, noyabr' 1963 g., 40-50

TOPIC TAGS: ocean dynamics, ocean current, atmospheric pressure, wind velocity

ABSTRACT: Nonperiodic ocean current changes were investigated on the basis of observations made in the Atlantic and Pacific Oceans and the application of the Chebyshev polynomial expansion to atmospheric pressure processes. Data collected in the Atlantic, Pacific, and Indian Oceans by the vessels Mikhail Lomonosov, Voyeykov, and Shikal'sky indicated that the upper layers of the oceanic currents are affected by the tradewinds, that the Cromwell current in the Pacific Ocean is of a compensation type, and that an increase in wind velocity causes an increase in the velocity of the upper current layers. The study shows that 1) the current regime of the equatorial zone of the Atlantic Ocean is similar to that of the Pacific Ocean; 2) constant tradewinds cause the ocean's surface to incline from west to east; 3) part of the water moving from the west sinks

Card 1/2

L 33793-66

ACC NR: AT6006573

to a considerable depth and then moves rapidly toward the eastern coast line; 4) strong current layers at depths of 100-300 m. exhibit maximum direction stability and velocity; 5) oscillations of 72 hr duration observed in the Atlantic, Pacific and Indian Oceans are probably stimulated by the nonperiodic atmospheric processes. Orig. art. has: 4 figures, 2 tables, 2 formulas.
