KURATOWSKI, Kazimierz

"Waclaw Sierpinski," by Kazimierz Kuratowski, full member of the Polish Academy of Sciences. Nauka Polska, Polish Academy of Sciences, Warsaw, 4th Year, No. 1(13), 1956.

KHRATOWSKI, V

Kuratowski, K. Quelques propriétés de l'espace des ensembles LC^n. Bull. Acad. Polon. Sci. Cl. III. 5 (1957), 967–974, LXXXI. (Russian summary)

Let Y be a complete metric space; the family $LC^n(Y)$ of all its compact LC^n subsets can be made into a complete metric space [Kuratowski, Fund. Math. 43 (1956), 114–138; MR 18, 58]. It is shown here that if $A \in LC^n(Y)$, X is a perfect compact space, dim $X \leq n+1$, and $f: X \to A$ is continuous, $f(X) = A$, then for every $\varepsilon > 0$ there is a neighborhood $\mathfrak{A}$ of A in $LC^n(Y)$ such that for every $B \in \mathfrak{A}$ there is a $g: X \to B$ with $g(X) = B$ and $|g - f| < \varepsilon$. As consequence: If $A \in LC^n(Y)$, dim $A = m \leq n+1$, there is a neighborhood of A in $LC^n(Y)$ composed exclusively of sets with dimension $\geq m$. More generally, if $A \in LC^n(Y)$ has a property invariant under "small transformations" [Kuratowski, Topologie, v. II, Warszawa, 1952; MR 14, 892], there is a neighborhood of A in $LC^n(Y)$ composed exclusively of sets having the same property.   J. Dugundji (Los Angeles, Calif.)

★ **Kuratowski, Casimir**. Topologie. Vol. I. 4éme éd. Monografie Matematyczne, Tom 20. Państwowe Wydawnictwo Naukowe, Warsaw, 1958. xiii+494 pp. This is essentially a reprint of the 3rd edition [MR 14, 1000; for 2nd edition see MR 10, 389], with an appendix in which the author gives a brief account of some of the topics not contained in earlier editions. These are, in particular, the concepts of completely regular space, bicompact space, and the Cartesian product of Tychonov. The appendix also contains two short notes, one by A. Mostowski on some applications of topology to mathematical logic, the other by R. Sikorski on the applications of topology to functional analysis.

August 10, 1959

On the Extension of the Concept of a Rational Functions in an n-Dimensional
Euclidean Space   Kuratowski, K. Sur l'extension de la notion de fonction
rationnelle à l'espace euclidien n-dimensionnel. Bull.
Acad. Polon. Sci. Sér. Sci. Math. Astr. Phys. 6 (1958),
281–287.

    1.5\W

    Let F be a compact subset of n-dimensional euclidean
space $\mathfrak{E}^n$ ($n \geq 2$), let $\mathfrak{S}_n$ be the n-sphere identified with the
one point compactification of $\mathfrak{E}^n$, and let $\mathfrak{P}_n$ denote $\mathfrak{E}^n$
minus its origin. Let $\mathfrak{B}_{n-1}(F)$ denote the set of homotopy
classes of continuous mappings of F into $\mathfrak{P}_n$. $\mathfrak{B}_{n-1}(F)$ is
an abelian group by means of the cohomotopy multi-
plication. Denoting by R_0 the unbounded component of
$\mathfrak{E}^n - F$ and by $R_1, R_2, \cdots$ the sequence of bounded
components of $\mathfrak{E}^n - F$, let $p_i \in R_i$ for $i = 1, 2, \cdots$. The
main result of the paper is the following theorem: The
homotopy classes of the translations $(x - p_1)|F, (x - p_2)|F,$
$\cdots$ form a free system of generators of $\mathfrak{B}_{n-1}(F)$.
    The arguments are similar to those of Borsuk [Fund.
Math. 37 (1950), 217–241; MR 13, 150]. The author
asserts that his main objective is to prove an analogous
result for open subsets G (in place of F) to appear in a
subsequent paper.   *E. H. Spanier* (Princeton, N.J.)

PHASE I BOOK EXPLOITATION   SOV/2660

Trudy, t. 4: Kratkoye soderzhaniye sektsionnykh dokladov. Doklady inostrannykh uchenykh (Transactions of the 3rd All-Union Mathematical Conference in Moscow. vol. 4: Summary of Sectional Reports. Reports of Foreign Scientists) Moscow, Izd-vo AN SSSR, 1959. 247 p. 2,200 copies printed.

Sponsoring Agency: Akademiya nauk SSSR. Matematicheskiy institut.

Tch. Ed.: G.N. Shevchenko; Editorial Board: A.A. Abramov, V.G. Boltyanskiy (Resp. Ed.), A.V. Emil'yev, B.V. Medvedev, A.D. Myshkis, S.M. Nikol'skiy (Resp. Ed.), A.G. Postnikov, Yu. V. Prokhorov, K.A. Rybnikov, V. I. Glivenko, V.A. Uspenskiy, N.G. Chetayev, O. Ye. Smilov, and A.I. Shirshov.

PURPOSE: This book is intended for mathematicians and physicists.

COVERAGE: The book is Volume IV of the Transactions of the Third All-Union Mathematical Conference, held in June and July 1956. The book is divided into two main parts. The first part contains summaries of the papers presented by Soviet scientists at the Conference that were not included in the first two volumes. The second part contains the text of reports submitted to the editor by non-Soviet scientists. In those cases when the non-Soviet scientist did not submit a copy of his paper to the editor, the title of the paper is cited and, if the paper was printed in a previous volume, reference is made to the appropriate volume. The papers, both Soviet and non-Soviet, cover various topics in number theory, algebra, differential and integral equations, function theory, functional analysis, probability theory, topology, mathematical problems of mechanics and physics, computational mathematics, mathematical logic and the foundations of mathematics, and the history of mathematics.

TITLE: Using the variable isochronism of electron oscillations for enhancing the efficiency of phasochronous devices
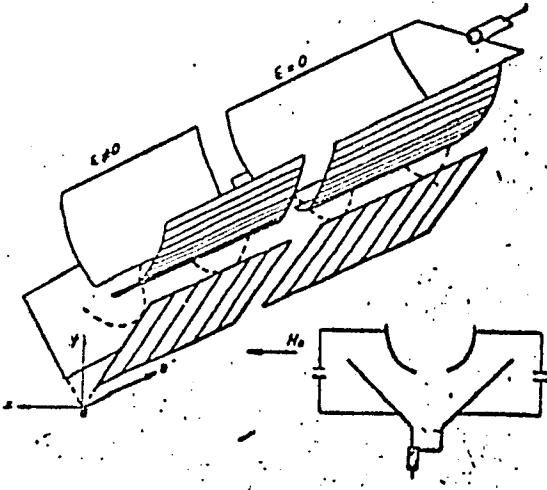

SOURCE: Vsesoyu znaya nauchnaya sessiya, posvyashchennaya Dnyu radio. 22d, 1966. Sektsiya elektroniki. Doklady. Moscow, 1966, 80-87

TOPIC TAGS: SHF amplifier, SHF oscillator, strophotron, traveling wave tube, backward wave tube

ABSTRACT: Four cascade arrangements are theoretically considered of a strophotron in whose first (bunching) sections the electron oscillations are non-isochronous while in the output sections the oscillations are isochronous. The SHF voltage is applied between the positive-electrode segments and between the negative plates (see figure); the strength of the field x-component is practically constant with-in a wide range of x. It is demonstrated that a system of equations descriв̲...

strophotron bunching section can be replaced by a system of nonlinear equations describing TW and BW tubes. The strophotron output section is described by another system of differential equations whose solution yields new equations that describe the amplitude and phase of the output SHF voltage. It is found that the maximum tube efficiency is independent of its gain parameter μ. A numerical example, which uses J. D. Rowe's results, shows that the above cascade strophotron has better than double the efficiency of the conventional strophotron. Orig. art. has: 3 figures and 28 formulas.

TITLE: Possibility of parametric amplification in axially nonuniform systems having centrifugal electrostatic focusing

SOURCE: Radiotekhnika i elektronika, v. 11, no. 3, 1966, 553-555

TOPIC TAGS: electronic amplification, parametric amplification

ABSTRACT: Periodic space variation of the focusing voltage in an axially nonuniform system (see Fig. 1) can be used for parametric amplification of cyclotron-type oscillations of electrons. Coupling elements 1 and 3 are described by R. H. Pantell (Mikrowellenrohren, Vortrage der Internat. Tagung, München, 1960, 6 386-389). amplifying section 2 may be connected in two ways (see Fig. 2): (a) the focusing-voltage periodicity is due to different voltages on the alternate screen elements or (b) the periodicity is created by sagging fields.

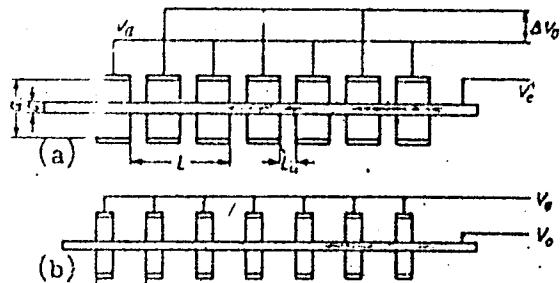

Fig. 2

Equations of the electron motion are set up, reduced to a Mathieu equation, expanded into a Fourier series, and solved according to the E. T. Wittaker method yielding a formula for the amplifier gain.   The electro-static electron drive combined with electrostatic focusing is seen as an advantage of the above amplifier.   Its disadvantages are: 1) possible noise and 2) nonisochronous "cyclotron" oscillations under large signal conditions.   [03]

TOPIC TAGS: successive approximation, nonlinear motion equation, rectangular waveguide, SHF oscillator, backward wave oscillator

ABSTRACT: A method of successive approximations is developed for the solution of essentially nonlinear equations of electron motion in an E-type helitron-SHF oscillator. These equations under specific conditions were reduced to a system analogous (excluding the sign in the equation of motion) to a corresponding system for linear O-type devices. An analysis of the dependence of the efficiency of the helitron on the current magnitude of the device is performed with the extensive use of the abovementioned analogy in the nonlinear properties of O- and E-type devices. The approximate equations obtained are also applied to an analysis of a resonance BWT (backward-wave tube), i.e., to a narrow-band circuit of increased efficiency and power and a

TITLE: Features of starting conditions in super-high-frequency oscillators with curvilinear periodical electron fluxes and immodified waves

SOURCE: Ref. zh. Elektronika i yeye primeneniye, Abs. 12A21

REF SOURCE: Tr. molodykh uchenykh. Saratovsk. un-t. Vyp. fiz. Saratov, 1965, 23-42

TOPIC TAGS: electron flux, SHF oscillator, magnetron

ABSTRACT: An analytic investigation is made of a two-dimensional problem of the starting characteristics of a E-type device: a helitron (H), assuming small transverse dimensions of the reaction space of the device, low HF-disturbances of the steady-state trajectories of the electrons (E) for thin E fluxes. In the analysis of the effect of the space charge (SC) on the grouping of electrons it is demonstrated that in the G under the effect of the radial and azimuthal forces of repulsion of electrons, azimuthal grouping is improved, and besides it is found that in devices with low SC densities, the application of internal transmission lines is more effective from the standpoint of starting conditions, and in devices with high SC densities, external transmission lines, although the general dependence is such that as the SC density increases $(CN)_{st}$

0

decreases. In the analysis of the effect of reflection from the load on the starting conditions of a G it is demonstrated that as the length of the G system decreases, the degree of the dependence of $(CN)_{st}$ and ω_{st} upon the reflection factor from the load sharply increases. A number of graphs are given characterizing the starting conditions of the G in various parameters of the device calculated according to the formulas obtained. TITLE: Coalescence of photons in the Coulomb field of nuclei   17

PERIODICAL: Zhurnal eksperimental'noy i tekhnicheskoy fiziki, v. 44, no. 3,
               1963, 1015-1022

TEXT: Z. Fried (Ref. 1: Nuovo Cim., 22 1303, 1961) investigated the coalescence
of low frequency photons on electrons (an inverse double Compton effect). The
authors investigate the same problem for photons of high frequencies ($\omega_i \gg m$;
m = mass of the electron, ω_i = frequency of the photons) and show that the basic
mechanism of coalescence of such photons is the coalescence in the Coulomb field
of the nucleus. They obtain expressions for the probability of such type of
coalescence and specialize them for the limiting cases of large and small photon
frequencies as compared to the electron mass. Coalescence of photons in the high
frequency region is investigated by the dispersion relation method. The low
frequency range is investigated by introducing radiative corrections to the
Lagrangian function of the electromagnetic field. At low frequencies their results

TITLE: $K \to 2\pi$ decays and $SU(3)$ symmetry

SOURCE: Yadernaya fizika, v. 2, no. 2, 1965, 272-276

TOPIC TAGS: unitary symmetry, particle symmetry, tadpole model, meson, radioactive decay

ABSTRACT: $K \to 2\pi$ decay is analyzed on the basis of the Coleman-Glashow dynamic model (the "tadpole model"). Two versions of this model are considered. The weaker version considers only the transitions into vacuum of scalar particles which belong to the unitary octet. In the strong version, diagrams are considered in which the octet of scalar particles also acts as intermediate resonances with the lowest energies. Since scalar particles are the virtual states with lowest energy for the $K \to 2\pi$ process, the second version of this model is of greatest interest for this type of decay. A general expression is derived for the amplitude of decay in the first version with regard to moderately strong and electromagnetic interactions. It is shown that the second version of the tadpole model results in suppression of

electromagnetic transitions in the tadpole diagrams for masses of the scalar octet
particles considered by Coleman and Glashow (S. Coleman, S. L. Glashow, *Phys. Rev.*,
134, 671, 1964). $K^+ \to \pi^+ \pi^0$ decay takes place through tadpole-less diagrams, which
are difficult to evaluate because of their complexity. Orig. art. has: 2 figures,

cooling

ABSTRACT: Since there is no published data available on the heat transfer of fluids
at close to critical conditions, a study was made of the heat transfer in the turbu-
lent flow of carbon dioxide at very high temperature gradients. The experiments were
conducted in a steel tube with a 4.05 mm inner and a 5.0 mm outer diameter and a
length of 51 d. The experiments were conducted with pressures of 785 — 981 n/m^2,
mean fluid temperatures of 20 — 110C, temperature gradients up to 500C, and heat
flux densities of 2.6 10^6 w/m^2. Changes in the liquid and wall temperatures along
the tube were plotted. The experimental data could be correlated with an accuracy of

±20% by use of the following formula:

$$Nu_\ell = Nu_0 \left(\frac{\rho_\ell}{\rho_\ell}\right)^{0.3} \left(\frac{\overline{c_p}}{c_{p \cdot \ell}}\right)^n$$

$$n = 0.4 \text{ at } T_w/T_m \leqslant 1 \text{ or } T_\ell/T_m \geqslant 1.2;$$

$$n = n_1 = 0.22 + 0.18 (T_w/T_m) \text{ at } 1 \leqslant T_w/T_m \leqslant 2.5;$$

$$n = n_1 + (5n_1 - 2)(1 - T_\ell/T_m) \text{ at } 1 \leqslant T_\ell/T_m \leqslant 1.2,$$

where Nu_ℓ is the liquid Nusselt number; Nu_0 is the Nusselt number determined by a theoretical formula previously derived by B.S. Petuchov and V.V. Kirillov (Teplo-energetika,No 4, 1958); ρ, density; c_p, specific heat at constant pressure; T_m, temperature at which the heat capacity of the liquid has a maximum; T_w, wall temperature, and subscripts ℓ and w refer to the condition of the liquid and the wall, respectively. The graphs showed that the wall temperature increases more sharply than the liquid temperature. At small heat flux densities and large mass flow rates, the wall temperature increases steadily as the liquid temperature increases, i.e., in the flow direction. However, at relatively large heat flux densities and small mass flow rates, the wall temperature increases up to the point where the liquid temperature equals the temperature at which the heat capacity is a maximum, then it decreases, and then, as the liquid temperature increases further, it increases again. TITLE: Structural transformations in titanium alloys

SOURCE: Soveshchaniye po metallokhimii, metallovedeniyu i primeneniyu titana i yego splavov, 6th. Novyye issledovaniya titanovykh splavov (New research on titanium alloys); trudy soveshchaniya, Moscow, Izd-vo Nauka, 1965, 82-88

TOPIC TAGS: titanium, titanium alloy, electron microscopy/ VT3-1 alloy, VT14 alloy, VT16 alloy, VT15 alloy, VT10 alloy, annealing, phase composition, alloy

ABSTRACT: The structural transformations induced by annealing in $(\alpha + \beta)$ alloys of the types VT3-1, VT14, and VT16, in β alloy of VT15 and in α alloy of VT10, containing an intermetalloidal strengthening agent, were studied. The study was carried out by means of electron microscopy. Electron microscope photographs of specimens annealed at different temperatures are presented. Annealing alloys under different conditions leads to a phase transformation in the alloys. The optimum phase composition that possesses maximum strength and plasticity was found to consist of single α - phase regions and highly dispersed heterogeneous $(\alpha + \beta)$ phase regions resulting from the decomposition of the metastable β-phase. Thermal stability of alloys may be increased by the addition of aluminum to the alloy. Orig. art. has: 2 figures.

TITLE: The titanium alloy BT10 (VT10) with elevated creep limit.

SOURCE: Titan v promyshlennosti; sbornik statey. Ed. by S.G. Glazunov.
          Moscow, 1961, 216-226.

TEXT: The paper summarizes the current state of the metallurgy of Ti-Al-Cu-
Sn alloys (refs. to Bunshah, R.F., Margolin, H., Trans. ASM, v.51, 1959; Holden,
F.C., et al., J. Metals, no.7, 1955, 117; Frost, P.D., Metal Progress, v.75, no.4,
1959, 91-96), which have been found to be highly creep-resistant, and describes an
experimental investigation of alloys containing 4.8-6% Al, 2-3.7% Cu, and 2-3% Sn,
intended to attain a high-strength Ti alloy with a maximal creep limit at 500°C.
TГ0 (TG0) sponge Ti was used with the addition of pure metallic Al, Cu, and Sn
and binary Al-Cu and ternary Al-Cu-Sn ligatures. The melts were fused in a vacu-
um arc furnace. Forging preheat to 1,030-1,050° was performed in an electric
furnace. Following 1-hr anneal at 800° and air-cooling, tests were performed at
room T and elevated T. Thermal stability was tested by room-T tests after 50-
100-hr aging at 500° with and without stress. Both Cu and Al are strengthening
additions. Yet, they diminish the plasticity in equal measure. 500° aging streng-
thens the alloy and reduces its plasticity. This consideration limits the Cu content
to 3.5% and the Al content to 6%. The microstructure of the alloy comprises an α
phase and an intermetallic Ti₃Cu compound. Aging does not effect any appreciable
Card 1/3

The titanium alloy BT10 (VT10) with elevated creep...   S/762/61/000/000/020/029

structural change. High-temperature (HT) tests at 500°C indicate improved short-duration strength with increasing Cu and Al content. 100-hr stress-rupture tests indicated that a strength of 48-52 kg/mm^2 requires no less than 5% Al and 2.8% Cu. Such alloys exhibit stress-rupture strengths of 30 kg/mm^2 at 550° and 18 kg/mm^2 at 600°. Cu and Al improve the creep resistance of the alloy, with an optimal creep strength with 6% Al and 3.7% Cu, but at a sacrifice in plasticity. Sn, also, exerts a favorable effect on creep strength. The residual-creep-strain data exhibited some scatter. Optimal overall mechanical properties at 20 and 500° with satisfactory thermal stability are thus attained by an alloy with 5-6% Al, 2.8-3.5% Cu, and 2-3 % Sn. Edurance-test data are reported as entered on the specification sheet for the VT10 alloy, together with data for the determination of a scale factor to account for the diameter of the test specimen. At RT the 10^{-7}-cycle endurance limit for a smooth specimen 5-mm diam is appx. 50 kg/mm^2. Compression, torsion, and shear-test data are tabulated. Ultra-short-duration tensile tests at 600, 700, and 800° are reported and compared with similar data on the BT8 (VT8) alloy. Low-T test results obtained at -40, -70, and -196°C are reported. A complete full-page tabulation of the physical properties of the VT10 alloy is provided. Inasmuch as Cu is a eutectoid β stabilizer, tests were made to explore the effect of quench, temper-ing, rate of cooling during quench, etc., on the properties of VT10. The results were totally negative; quench cannot fix the β phase (cf. Blok, N.I., et al., same

Card 2/3

The titanium alloy BT10 (VT10) with elevated creep... S/762/61/000/000/020/029

compendium, pp. 227-231, Abstract S/762/61/000/000/021/029). VT10 is not an $\alpha + \beta$ Ti alloy, but an α alloy with an intermetallic-compound strengthener. The present study essentially is an investigation of the relaxation and recrystallization process following forging deformation and reheating. Ti is characterized by a less than normal (for metals) uniformity in the rate of recrystallization and the grain size resulting from it. Reheating of VT10 after deformation leads to relaxation at 700°, as indicated by sharply defined X-ray interference rings with a distinct doublet. Recrystallization sets in at 800°, with individual reflections on the rings. The number of individual points increases with increasing T. Texture is preserved up to 950°. Beyond 950° the rings are transformed into individual spots, which suggests completion of the recrystallization at a T which coincides with the phase-recrystallization T. The end product of this investigation is a VT10 alloy of the Ti-Al-Cu-Sn system with an elevated creep strength (28-30 kg/mm² with 0.2% residual strain after 100 hrs at 500°C). The alloy is currently being operationally tested on parts operating at 500°. There are 11 figures (including an over-page-size fold-out with X-ray photos), 4 tables, and 4 references (1 Russian-language Soviet and 3 English-language U.S., all cited in the text). The participation of lab assistant Zh.D.Afanas'yeva in the experimentation and that of M.I.Yermolova in the recrystal-lization X-ray study is acknowledged.

TITLE: Phase analysis of the BT10 (VT10) titanium alloy.

SOURCE: Titan v promyshlennosti; sbornik statey. Ed. by S. G. Glazunov. Moscow, 1961, 227-231.

TEXT: This paper describes an experimental X-ray and chemical analysis of electrolytically precipitated VT10 alloy (after 1-hr 800°C anneal in vacuum), performed by a method described in Zavodskaya laboratoriya, no.2, 1958, 141. The investigation was motivated by a desire to determine whether the age hardening of this creep-resistant Ti-Al-Cu-Sn alloy is produced by the separation of some intermetallic-compound phase, since this alloy, like the two-phase Ti-Cu alloys, has no residual β phase that could be fixed by quenching. Reference is made to the phase diagram of A. Joukainen, et al. (J.Metals, v.4, no.7, 1952, 766), according to which Ti_2O is the intermetallic phase richest in Ti. The present investigation identified an intermetallic phase of variable composition with a tetragonal face-centered crystal lattice of the Ti_2Cu type, namely $(Ti,Al,Sn)_3Cu$. The phase compositions of VT10 alloy with slightly variable Cu and Al contents and after cooling at various rates, as obtained by the X-ray and the chemical method, are tabulated. All findings support the conclusion that the (Ti,Al,Sn)-to-Cu ratio is extremely close to 3. The Ti_3Cu-type phase thus identified is a solid solution in which some nodes of the

Card 1/2

Phase analysis of the BT 10 (VT 10) titanium alloy.   S/762/61/000/000/021/029

crystalline lattice, ordinarily occupied by Ti, are occupied by Al and Sn atoms. An increase in Cu content from 2 to 3% increases the quantity of $(Ti, Al, Sn)_3Cu$ continuously from 5.75 to 8.35%. No comparable change occurs upon increase of the Al content from 5 to 6%. It is concluded that the VT 10 alloy gives rise to highly dispersive products of a eutectoid reaction $\beta \rightarrow \alpha + (Ti, Al, Sn)_3Cu$. X-ray analysis indicates that the fundamental phase in VT 10 is an α phase, both primary and transformational (α'). No residual β phase can be found in the alloy. It is known that in Ti-Cu alloys the eutectoid decomposition upon cooling from elevated T occurs very rapidly. It proceeds even more speedily in alloys of the Ti-Al-Cu-Sn system, and the β phase decomposes in toto into an α phase and an intermetallic compound. The effects of the temperature levels and rates of cooling on the phase composition are tabulated in detail. The structural changes in the VT 10 alloys apparently are determined by three factors: (1) Change in the size of the primary grains; (2) change in the shape of the particles of transformed β phase (α' phase); and (3) change in the shape of the particles of the intermetallic phase $(TiAlSn)_3Cu$ and the character of its distribution. There are 1 figure, 5 tables, and 4 references (1 Russian-language Soviet, 2 English-language, and 1 German). The participation of Zh.D. Afanas'yeva, Ye.A.Vinogradova, Ye.I.Zvontsova, and L.V. Polyakova in the experimental portion of the investigation is acknowledged.

TITLE: Phase analysis of alloys on titanium basis

PERIODICAL: Zavodskaya laboratoriya, v. 27, no. 12, 1961, 1470 - 1472

TEXT · α+β-alloys with stabilized β-phase, and α-alloys with intermetallic
hardening were examined. The individual phases were isolated by anodic
solution of the alloy in anhydrous electrolyte (3 g of KCNS or 2 g of
LiCl, 10 g of citric acid, and 1200 milliliters of methanol). There-
after, they were subjected to X-ray structural and chemical analysis.
Mo, V, Nb, and Ta were identified as stabilizers for the β-phase, the effect
of which decreases in the sequence mentioned. (In the presence of 4% Mo
the content of the β-phase in the alloy is 11%; at 4% V, it is 9%, and
at 4% Nb or Ta, only 3%). After forging, the anodic deposit of these
alloys consists entirely of β-phase. In the presence of 4% Ta, alloys
aged for 100 hr at 500°C show only small quantities of β-phase, whereas
4% Mo or V completely prevent the β-phase from decomposing. Ti-Cu
alloys containing up to 5% Cu have one phase of the composition Ti_3Cu

Card 1/2

Phase analysis of alloys on ...

with tetragonal face-centered lattice. A phase of the type Ti_3Cu of different composition was also observed in Ti-Al-Cu-Sn alloys (containing up to 3.5% Cu). An increase of the Cu content of these alloys from 2 to 3.5% results in a rise of the content of $(Ti,Al,Sn)_3Cu$ phase from 5.75 - 6.25 to 8.02 - 8.34%. Thus, strength increases from 95 - 100 to 104 - 110 kg/mm^2. In this case, specific elongation decreases from 35 to 30 - 22%. Ye. A. Vinogradova, Ye. V. Zvontsova, and L. V. Polyakova assisted in the experiments. There are 1 figure, 3 tables, and 5 references: 2 Soviet and 3 non-Soviet. The two references to English-language publications read as follows: N. Karlsson, J. of the Institute of Metals, 79, 391 (1951); A. Gaukainen, N. J. Grant, C. F. Floe, J. of Metals, 4, no 7, 766 (1952).

         cation. Leather. Fur. Gelatin. Tanning Agents.
         Technical Proteins.

Abs Jour   : Ref Zhur - Khimiya, No 3, 1957, No 10508

Abstract   : between the hair bulbs and the follicles. Orizon also con-
             tains enzymes which dissolve the fats. The fermentation me-
             thod makes possible the production of large quantities of
             bristles of superior quality, does not lengthen the produc-
             tion cycle, and somewhat reduces the fat content in the fi-
             nished skin.

GOLUBBVA, S.K., kand. tekhn. nauk; KURAYTIS, S.A., kand. tekhn. nauk.

Auxiliary substances used in fixation of tanning materials, dyes
and sulfonated fats in leathers. Leg. prom. 17 no.12:24-27 D '57.
         (Tanning)   (Dyes and dyeing--Leather)   (MIRA 11:1)

SHERBUVA, S.K., kand.tekhn.nauk; KURAYTIS, ..., kand.tekhn.nauk

Sulfonated products from cottonseed oil and corn oil. Leg.prom.
18 no.6:36-37 Je '58.   (MIRA 12:10)
      (Leather industry) (Sulfonated oils)

KURAYTIS, S.A.; GOLUBEVA, S.K.

Synthetic tanning material No.4. Leg. prom. 18 no.9:23-26
S '58.   (MIRA 11:10)
            (Tanning materials)

COLUBEVA, S.K., kand.tekhn.nauk; KURAYTIS, S.A., kand.tekhn.nauk

Synthetic tannin with high forming and filling characteristics.
Kozh.-obuv.prom. no.1:30-32 Ja '59.   (MIRA 12:6)
                (Tanning materials)

GOLUBEVA, S.K., kand.tekhn.nauk; KURAYTIS, S.A., kand.tekhn.nauk

TSNIKP-1 fixing agent. Kozh.-obuv.prom. no.6:19-22 Je '59.
(MIRA 12:9)

(Tanning)

METBIKIN, A.I., kand.tekhn.nauk; KURAYTIS, S.A., kand.tekhn.nauk;
     GOLUBEVA, S.K., kand.tekhn.nauk.

     Use of pine bark tannides. Izv.vys.ucheb.zav.; tekh.leg.prom.
     no.6:52-57 '59.   (MIRA 13:5)

     1. Tsentral'nyy nauchno-issledovatel'skiy institut khozevenno-
     obuvnoy promyshlennosti.
                     (Tanning materials)

GOLUBEVA, S.K., kand.tekhn.nauk; KRASUKHIN, M.N., kand.tekhn.nauk;

   nauk; MENKEL, P.Ya., kand.tekhn.nauk; KORZINA, Ye.S., mladshiy
   nauchnyy sotrudnik; FILIPPOVA, N.B., mladshiy nauchnyy sotrudnik

Works of the Central Scientific and Technical Institute of the
Leather and Footwear Industry in the field of tanning materials.
Nauch.-issl. trudy TSNIKP no. 30:27-46 '59.   (MIRA 14:5)
                    (Tanning materials)

METELKIN, A.I., kand.tekhn.nauk; KURAYTIS, S.A., kand.tekhn.nauk;
     GOLUBEVA, S.K., kand.tekhn.nauk

Use of the fixation agent developed by the Central Scientific
Research Institute of the Leather and Shoe Industry for
processing goatskins. Kozh.-obuv. prom. 2 no. 11:14-16 N '60.
                                               (MIRA 13:12)
          (Hides and skins)

KURAYTIS, S.A., kand.tekhn.nauk; GOLUBEVA, S.K., kand.tekhn.nauk

Cation-active emulsifier. Izv.vys.ucheb.zav.; tekh.leg.prom. no.5:
16-20 '60.   (MIRA 13:11)

1. TSentral'nyy nauchno-issledovatel'skiy institut kozhevenno-obuvnoy
promyshlennosti. Rekomendovana kafedroy tekhnologii kozhi Kiyevskogo
tekhnologicheskogo instituta legkoy promyshlennosti.
            (Emulsifying agents)   (Tanning)

KURAYTIS, S.A.; GOLUBEVA, S.K.; KORNYUKHINA, M.A.; KIR'YANOVA, L.F.

Characteristics of goatskin leather tanning with chromium salts
in the presence of cation-active compounds. Nauch.-issl.trudy
TSNIKP no.32:22-28 '60.   (MIRA 15:12)
                (Tanning)   (Surface-active agents)

METELKIN, A.I., kand.tekhn.nauk; KURAYTIS, S.A.

    Use of pine extract tannins in processing sole leather.
    Koz.-obuv.prom.3 no.4:21-23 Ap '61.   (MIRA 14:5)
                  (Tanning)

KURAYTIS, S.A., kand.tekhn.nauk; GOLUBEVA, S.K., kand.tekhn.nauk

"BNF" synthetic tanning agent. Kozh.-obuv.prom. 3 no.8:26-27
Ag '61.   (MIRA 14:10)
                    (Tanning materials)

FILIPPOVA, N.B., inzh.; KURAYTIS, S.A., kand.tekhn.nauk

Synthetic tanning agent No.12-1 and experience in its use in
leather processing. Kozh.-obuv.prom. 3 no.8:36-37 Ag '61.
(MIRA 14:10)

(Tanning materials)
