TITLE: The weighting function for a waveguide partially filled with a ferrite and a dielectric

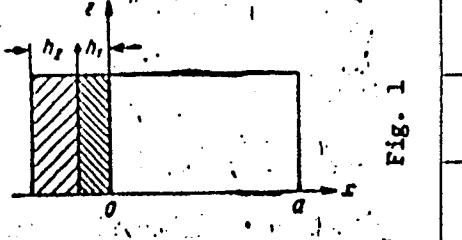

SOURCE: Vsesoyuznaya nauchnaya sessiya, posvyashchennaya Dnyu radio. 22d, 1966. Sektsiya kvantovoy elektroniki. Doklady. Moscow, 1966, 94-97

TOPIC TAGS: rectangular waveguide, waveguide propagation, dielectric layer waveguide, wave function

ABSTRACT: The cross section of a rectangular waveguide partially filled to the left of the  $x$  axis with a ferrite material and a dielectric is shown in figure 1. Using boundary conditions, Green's function for the electrical field is derived:

$$\Gamma(x, x_0) = -4\pi \frac{(\alpha x \cos \alpha x - k \sin \alpha x) \sin \alpha (x_0 - a)}{\alpha \cos \alpha (x_0 - a) \{[\alpha x + k \lg \alpha (x_0 - a)] \cos \alpha x_0 -} \\ \rightarrow -[k - \alpha x \lg \alpha (x_0 - a)] \sin \alpha x_0 \quad (1)$$

$x < x_0.$

Card 1/3

ACC NR: AT6022282

where  $\alpha^{-1} = Y_0 + \frac{i}{w_1} \sin x_1 h_1 + (Y_2 - Y_0) \cos x_1 h_1$

$$\alpha^{-1} = Y_0 + \frac{w_1}{\cos x_1 h_1 + i w_1 (Y_2 - Y_0) \sin x_1 h_1}$$

and

$$Y_0 = \frac{i \omega \mu_a}{k \mu_1 \mu}; \quad Y_2 = i w_2 \operatorname{ctg} x_2 h_2;$$

$$w_1 = \sqrt{\frac{\mu_1}{\epsilon_0 - \frac{\sigma^2}{(h_1 \mu_1)^2}}}, \quad w_2 = \sqrt{\frac{\mu_g}{\epsilon_g - \frac{\sigma^2}{(h_2 \mu_g)^2}}};$$

$$x_1^2 = k^2 \epsilon_0 \mu_1 - \sigma^2, \quad x_2^2 = k^2 \epsilon_g \mu_g - \sigma^2;$$

$h_1, h_2$  are the thicknesses of the ferrite and the dielectric layers, respectively,  
 $\mu, \mu_a$  are the tensor components of the permeability  $\|\mu\|$ ;

$$\mu_1 = \mu - \frac{\mu_a^2}{\mu}; \quad k = \frac{2\pi}{\lambda};$$

$\epsilon_0, \epsilon_g$  are the dielectric constants of the ferrite and the dielectric layers, respectively. For the special case when  $\alpha_0 \rightarrow 0$ , i. e., the boundary coincides with the sur-

Card 2/3

ACC NR: AT6022282

face of the ferrite layer,  $E_z$  can be derived from (1) using inverse Fourier transform,

$$E_z = -2 \int_{-\infty}^{\infty} \frac{\alpha \sin x(x-a) e^{-i\sigma x} d\sigma}{\cos x a (\alpha x + k_1 g u a)}$$

TITLE: Calculation and investigation of electromagnetic fields in the ferrite-dielectric-loaded waveguides

CITED SOURCE: Uch. zap. Kuybyshevsk. gos. ped. in-t, vyp. 42, 1964, 75-80

TOPIC TAGS: waveguide, ferrite loaded waveguide ✓

TRANSLATION: An experimental method is suggested for finding the field configuration in the waveguides with ferrite slugs of arbitrary shapes. A lossy probe is introduced in the waveguide; the probe movement causes a variation in the waveguide transfer ratio proportional to the square of the tangential field component at the point of location of the probe. The probe shape and size depend on the mode. Results are cited of a verification of the method on the waveguides with a known field distribution; high accuracy is noted. An outfit for accurate measurement of low losses is described. Bibliography: 5 titles.

REF SOURCE: Tr. Komis. po spektroskopii. AN SSSR, t. 3, vyp. 1, 1964, 514-519

TOPIC TAGS: paramagnetic ion, spectrum, ION ENERGY

ABSTRACT: Calculations are presented of the energy spectrum of a paramagnetic ion in a crystal with spinel structure in the approximation of the average intracrystal-line field. It is shown that allowance for the field due to the second and farther neighbors can exert an appreciable influence on the interpretation of the spectra of such ions. Quantitative calculation results are presented for Cr<sup>3+</sup> in MgAl<sub>2</sub>O<sub>4</sub> and experimental data on this ion. [Translation of abstract]

TITLE: Determination of the energy spectrum of an impurity ion with an unfilled d-shell  
in a crystal

SOURCE: Optika i spektroskopiya, v. 19, no. 4, 1965, 586-596

TOPIC TAGS: crystal impurity, EPR spectrum, line splitting

ABSTRACT: The interpretation of energy spectra and EPR spectra of ions in various crystals requires the solution of a secular equation which takes into account the configuration of the ion and the symmetry of the intracrystalline field. In this paper, tables of matrix elements have been compiled which make it possible to write a secular equation at once for any term of any configuration in the case of an impurity ion with an unfilled d shell. These tables can also be used in studying EPR spectra if the field of lower symmetry produces a splitting comparable in order of magnitude to other perturbations (spin-orbital and exchange perturbations, etc.). As an example, the splitting of the principal

ACC NR: AP5025303

terms D and F in fields of variable symmetry was analyzed. Data on the optical spectra of Cr<sup>3+</sup> in MgAl<sub>2</sub>O<sub>4</sub> make it possible to determine local distortions caused by Cr<sup>3+</sup> ion which replaces Al<sup>3+</sup> ion at the octahedral sites of spinel. The data obtained are in good agreement with the experiment. Orig. art. has: 7 tables and 6 formulas.

A066/A126AUTHORS: Kuruts, I.Yu., Tarabiy, M.I., Shkoda-Ul'yanov, V.A.TITLE: The influence exerted by the width of the resonance range on the total cross sections of  $\gamma$ n-reactions determined by the method of thick specimens

SOURCE: Uzhgorod. Universitet. Nekotoryye problemy sovremennoy fiziki yadra i elementarnykh chastits; sbornik statey, no. 1, 1957, 73 - 78

TEXT: The procedure suggested previously (V.A. Shkoda-Ul'yanov. Nauchnyye zapiski Uzhgorodskogo Gosudarstvennogo universiteta, v. 18, 1956; B.I. Gol'danskiy and V.A. Shkoda-Ul'yanov. ZhETF, 623, 1955) for determining the total cross sections of  $\gamma$ n-reactions in thick specimens by the photon difference method is based on the assumption that the resonance range characterizing the excitation function of the  $\gamma$ n-reaction is narrow enough so that for  $E = E_p$  the factor

$$\frac{1}{\sigma_{abs}(E) E} \left[ 1 = \frac{Y(\epsilon)}{f(0)} \right]$$

Card 1/2

✓B

The influence exerted by the width of ....

S/381/51/000/001/007/013  
A066/A126

is equal to the value at which  $\sigma_{\gamma n}(E)$  reaches a maximum, and remains constant in the determination of the maximum photoneutron yield. This assumption, which is based on equations of the above papers, is proved to be justified. Photoneutron yields are calculated for Al, Cu, Pb, and for a maximum bremsstrahlung energy of 250 Mev. The results obtained here prove the applicability of the method proposed by the two above-mentioned authors. There are 3 tables.

AUTHOR: Kurutz, I.

TITLE: Method for controlling operation of a radial-flow (centrifugal) pump by adjusting the impeller blades

PERIODICAL: Referativnyy zhurnal, otdel'nyy vypusk. 34. Kompressory i tekhnika, no. 14, 1962, 13, abstract 34.14.99 (Acta techn. Acad. Scient. hung. v. 32, no. 3-4, 1961, 415-422 [English]).

TEXT: A method for controlling operation of centrifugal pumps by adjusting the angle of impeller blades is described, and the dependence of head and delivery on the twisting angle of the blades about an axis parallel to the pump axis is shown. Experimental and predicted relationships between head and delivery coefficients for three values of blade-setting angles are compared, and theoretical characteristics are plotted for the case of non-interrupted flow of an ideal fluid in a circular cascade of infinitely thin blades. The good agreement of experimentally predicted values in the field of optimum head and delivery proves the validity of the Hoffmeister method. [Abstractor's note: apparently the above method is meant]. It is shown that a pump with adjustable-blade impeller ensures higher efficiency in a wider range of operational characteristics and is therefore more economic than the same pump but with the fixed blades (stator) mounted at the pump inlet. There are 5 figures.

Problem of bending of wooden beams is treated by recognizing the nonlinear elastic stress-strain properties and unsymmetrical strength properties in tension and compression. A semiempirical design chart is presented for prediction of the failure moment of a beam of solid or flanged section, based on the ratio of tensile to compressive strength of the material.

An approach of this type is more rational than conventional modulus-of-rupture and form-factor methods, appears to be easier to apply, and limited experimental data indicate better accuracy.

SPONSORING AGENCY: Academy of SSSR. ORGANIZING GEOLOGO-PHYSICAL SURVEY  
WORK. PARTITION OF PERMAFROST AREAS.

EDITOR: V. N. Belyakov, N. A. Stepanov, and A. N. Chetvertikov. ED. ORGANIZATION:  
NAME: A. L. Baturin. TECH. ED.: Yu. V. Matsumi.

PURPOSE: This collection of articles is intended primarily for construction engineers and geologists interested in permafrost problems.

CONTENTS: This collection of articles contains reports originally discussed at the 7th Interdepartmental Conference on Permafrost held in Moscow in March, 1956. Materials of this conference were published in three issues: general permafrost studies, engineering aspects of permafrost (permafrost work, ground physics and mechanics). Individual articles of this work discuss basic problems of planning, building, and operating various buildings and structures in permafrost regions. Some of the information reported, particularly on permafrost earthworks construction, is new and appears for the first time in the literature on permafrost. Articles are accompanied by references.

TITLE: Cast Iron Shavings, Supplied Into the Fusion Zone of a Cupola Furnace With the Aid of a Worm Conveyor, Are Resmelted Without Briquetting (Pereplavka chugunnoy struzhki v vagranke bez briketirovaniya s pomoshch'yu shnekovoy podachi v zonu plavleniya)

PERIODICAL: V sb.: Rats. ispol'zovaniye struzhki i dr. otkhodov chernykh i tsvet. metallov. Moscow, Mashgiz, 1956, pp 352-360

ABSTRACT: The method was applied at the "Krasnyy oktyabr" [The Red October] plant in Krasnodar (1951-1953). The content of the shavings in the cupola charge amounted to 8.3%. The untreated shavings are charged into a device consisting of a hopper, mounted above the charging platform of the worm conveyor, and the drive mechanism of the latter. One side of the conveyor is connected to the hopper by means of a vertical tube, while the other side connects to the interior of the cupola furnace (CF) through an opening in the masonry. The axis of this opening is situated at a distance of 300 mm above the axis of the third, upper, row of tuyères, which ensures introduction of the

Card 1/2

Cast Iron Shavings, Supplied Into the Fusion Zone of a Cupola Furnace (cont.)

shavings into the fusion zone of the CF. The output of the device amounts to 200 kg of shavings per hour. A single CF 950 mm in diameter is serviced by two such units, each of which is powered by an electric motor rated at 4.5 kw. Introduction of shavings in an amount equivalent to 8% did not produce any perceptible changes in the temperature or the composition of the resulting cast iron. The hourly output of the CF's increased by 10%. The cost of the device described is ~2000 rubles.

Effect of a lead dioxide film upon the corrosion of a lead anode. G. Z. Kur'yakov and I. A. Korchmarck. *Zhur. Prilod. Khim.* 26, 021-4 (1953); cf. *C.A.* 47, 9183i.—Pb anodes alloyed with Ag and different combinations of Sn, Co, Sb, Mn, and Si, and without Ag but with Sn, Sb, Mn, and Al were placed between 2 Al electrodes in a 2*N* H<sub>2</sub>SO<sub>4</sub> soln. and subjected to a polarizing current of 400 amp./sq. m. for 2 weeks. Electrodes without Ag lost more than 10 times as much Pb as those with Ag. The process of corrosion consisted of: film formation of quadrivalent Pb, and salts formed in the electrolyte, which fell off as slime; and the passage of Pb<sup>++</sup> into the electrolyte and to the cathode. The presence of Ag decreased slime formation and retarded the diffusion of Pb<sup>++</sup> from the anode to the electrolyte. The addn. of elements forming insol. compds. thickened the film, retarding diffusion. The presence of Mn as an alloy or in the electrolyte did not effect the resistance to corrosion but reduced the amt. of Pb<sup>++</sup> passing into the electrolyte. The thickness rather than the porosity of the film was the controlling factor, but neither was directly related to the resistance of Pb anodes to corrosion. I. B.

AUTHORS: Chitifman, L. N., Suvtsillo, G. V., Murzakova, L. G. 10/7/73-8-5/66  
TITLE: Polarographic Determination of Several 2-Ethylanthroquinone Derivatives (Polyarograficheskoye opredeleniye nekotorykh proizvodnykh 2-etilantr.khinona)  
TOPICAL: Zhurnal obshchey khimii, 1958, Vol. 28, Nr 8, pp. 2028-2030  
ABSTRACT: The polarographic behavior of the anthroquinone compounds is considered in a number of papers (Refs 1-6). In the present paper polarographic investigations were carried out on the derivatives of 2-ethylanthroquinone, including 1-ethyl-anthrone and 2-ethyl-10-oxanthrone, according to the method described in reference 7. 0,001-0,01 molar solutions of 1-ethylanthrone and 2-ethyl-10-oxanthrone were used. The polarograms were taken on the following mixture: 0,6 mole  $[(C_2H_5)_4N]Br$  in a mixture of 61% methyl alcohol, 35% water, and 4% benzene (by volume); the per cent concentration of these solutions lay between 7,5 and 7,0. Under the experimental conditions the half-wave potential of 2-ethyl-

Card 1/2

77V/79-28-8-5/66

Electrographic Determination of Several 2-Ethylanthronequinone Derivatives

anthrone was at  $1,4 \pm 0,03$  V., while that for 2-ethyl-10-oxanthrone was at  $1,3 \pm 0,03$  V. The half-wave potentials of these two compounds in 0,6 mole bromotetramethylammonium in aqueous solution of methyl alcohol containing some benzene were therefore taken to be 1,4 and 1,3 V. (relative to a saturated calomel electrode). It was also found that the height of the waves for 2-ethylanthrone and 2-ethyl-10-oxanthrone are proportional to the concentration (0,001-0,01 molar) of the solution. There are 2 figures, 1 table, and 7 references, 3 of which are Soviet.

TITLE: Determination of manganese in gasoline and carbon scale

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 2, 1965, 46

TOPIC TAGS: manganese, gasoline, polarographic analysis

ABSTRACT: The authors proposed a polarographic method of determining bivalent manganese in cyclopentadienyltricarbonyl manganese in a supporting electrolyte consisting of an alkaline solution of triethanolamine with preliminary mineralization of the manganese compound samples and carbon scale with concentrated sulfuric acid. For the determination of manganese in gasoline, 4-6 ml of gasoline are put in a 250 ml Kjeldahl flask and 20 ml of concentrated sulfuric acid and 0.4 grams of potassium sulfate are added. The flask is heated until the solution becomes completely clear; if it does not become clear, hydrogen peroxide is added drop by drop. The clear solution is transferred to a 50 ml quartz beaker and the liquid is boiled off; then the residue is roasted in a muffle furnace at 800°C. After cooling the

Card 1/2

ACCESSION NR: AP5006823

residue is dissolved in sulfuric acid, transferred to a 100 ml measuring flask and distilled water is added to bring it up to the mark. Then 5 ml of the solution is transferred to a 50 ml measuring flask for polarographic analysis. Orig. art. has: 2 tables.

TITLE: Automatic Storage-Battery Charging for Mine Locomotives  
(Avtomatizatsiya zaryada akkumulyatornykh batarey rudnichnykh elektrovozov)

PERIODICAL: T. sb.: Avtomatizatsiya v ugol'no-prom-sti. M., Ugletekhnizdat,  
1956, pp 445-457

ABSTRACT: The storage-battery charging of mine locomotives is conducted under constant-current conditions, single-step charging being used for alkali batteries and 2-step charging for acid batteries. Type YSZSh-2Sh selenium rectifiers made by the Dnepropetrovskiy Plant maintain the charging current within a +5% and -11% range. Continuous charging-current control is effected in the rectifier by a voltage regulator comprising a saturation choke coil and a transformer or autotransformer. Ways of constructing saturation choke coils with a 4-core magnetic circuit are described. It is pointed out that an additional compensation winding and an appropriate regulator circuit diagram

Card 1/2

SOV/112-58-2-2336

**Automatic Storage-Battery Charging for Mine Locomotives**

permit decreasing the dimensions of the choke coil. To check the charging and discharging of the various storage batteries, and also to turn off a charged battery automatically, ampere-hourmeters are used. The Dnepropetrovsk Selenium-Rectifier Plant has developed two ampere-hourmeter designs after a "Sangallo" Company meter. In one design, the control element has been simplified; instead of a mercury bath with permanent magnets and strips, two parallel-connected resistors are used, one of which is adjustable and connected in series with the selenium rectifier. In the second design, a multipole magnet has been used in addition to the above alterations.

TITLE: Operation of Voltage Regulators on Mining-Type Charging Selenium Rectifiers (Rabota regul'atorov napryazheniya shakhtnykh zaryadnykh selenovykh vypryamiteley)

PERIODICAL: V sb.: Avtomatizatsiya v ugol'n. prom-sti. M., Ugletekhzdat, 1956, pp 470-475

ABSTRACT: Types VSZSh-70/36 and VSZSh-2Shch automatic selenium chargers are widely used for charging storage batteries of mining locomotives. The charging current is kept constant automatically as the voltage across the battery terminals rises. The principal components of the charger are: (1) selenium-disk rectifier units connected in a three-phase bridge circuit; (2) a three-phase voltage regulator consisting of a stepdown transformer (VSZSh-70/36 type) or an autotransformer (VSZSh-2Shch type) and a saturation

Card 1/2

8(2)

SOV/112-58-3-3917

**Operation of Voltage Regulators on Mining-Type Charging Selenium Rectifiers**

choke coil whose impedance, decreasing from additional magnetization as the battery voltage rises, insures the constant charging current. In the VSZSh-70/36 type, the stepdown-transformer primary and the saturation choke in series with it can be star or delta connected depending on the supply voltage. This has no effect on the voltage-regulator operation. In the VSZSh-2Shch type a star-connected autotransformer circuit is used. It has been found that if the autotransformer and the saturation choke coils are delta connected, the rectifier operating conditions change so much that its function is practically stopped. Phenomena occurring in the above types during the star-delta switching are examined, and the reasons precluding the operation of delta-connected VSZSh-2Shch type, which often seems desirable with 220 v supply voltage, are explained.

TITLE: The influence of noise on the determination of the direction of arrival of a wave with the aid of a moving receiver

SOURCE: Akusticheskiy zhurnal, v. 10, no. 3, 1964, 368-370

TOPIC TAGS: Doppler indicator, noise analysis, signal noise ratio, optimal band width, direction finding

ABSTRACT: A theoretical analysis is made of the effect of arbitrary noise on the direction of arrival of a signal with arbitrary spectrum, determined by means of the Doppler effect, using a moving receiver. The signal is assumed to be a stationary random function with a specified time spectrum. The noise is assumed to a random field, stationary in time and homogeneous in space, with a specified energy intensity at a given frequency and a given direction. Evaluation of the correlation functions of the signal and of the noise for two points separated in space and in time shows that the spectrum of the

Card 1/2

J-11049-62

ACCESSION NR: AP4044621

signal experiences a shift and broadening (or narrowing) in frequency. It is further shown that an optimal filter can be designed to separate the signal. This possibility is demonstrated for the particular cases of a monochromatic signal and monochromatic and isotropic noise, for isotropic nonmonochromatic white noise, and for narrow-band signal and noise. Some limits on the possible gain resulting from increasing the scanning speed are qualitatively indicated. Orig. art: has: 5 formulas.
