TITLE: Thermal decomposition of lithium peroxide

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 10, 1965,
1902-1904

TOPIC TAGS: lithium compound, lithium oxide, solid solution, heat of
decomposition, chemical reaction kinetics

ABSTRACT: The thermal decomposition of lithium peroxide under static
conditions was investigated in the 270-320 C range to provide data for
the kinetics of the reaction. The decomposition to lithium oxide and
oxygen was followed by differential manometric measurements and was
found to proceed without autoacceleration. A Li₂O₂-Li₂O solid solution
was formed when more than about 50% of the lithium peroxide was
decomposed. The apparent energy of activation of the lithium peroxide
decomposition was calculated to be 50 kcal/mole. X-ray analysis was
conducted by V. M. Bakulin and A. N. Zimin to support the conclusion

SOV/75-15-1-10/29**AUTHORS:** Busev, A. I., Zholondkovskaya, T. N., Kuznetsova, Z. M.**TITLE:** Separation of Gallium and Indium by the Diethyldithiocarbamate Method**PERIODICAL:** Zhurnal analiticheskoy khimii, 1960, Vol 15, Nr 1,
pp 50-56 (USSR)**ABSTRACT:** Conditions of Ga and In separation by precipitating In with sodium diethyldithiocarbamate or extracting it with ethyl acetate were studied. A review of the literature dealing with the determination and separation of Ga and In is also given. The following solutions were used: standard gallium nitrate solution (1 mg Ga/ml); standard indium nitrate solution (2.5 mg In/ml); 2% aqueous sodium diethyldithiocarbamate solution; and the following buffer solutions:0,2M CH₃COOH + 0,2M CH₃COONa, pH 3,72-5,57,

0,2M KCl + 0,2M HCl, pH 1,00-2,20,

0,2M H₃BO₃ + 0,05M Na₂B₄O₇, pH 7,09-9,11.

Card 1/5

Separation of Gallium and Indium by the Diethyl-
dithiocarbamate Method

77748
SOV/75-15-1-10/29

The data obtained show that quantitative precipitation of gallium with sodium diethyldithiocarbamate takes place at pH 2.7-5.0, but has no practical value since precipitation of many other elements also takes place under the same conditions. Precipitation of indium with sodium diethyldithiocarbamate is more selective;

tartrates, oxalates, and sulfosalicylic acid do not interfere. It was found that indium diethyldithiocarbamate can be quantitatively extracted with ethyl acetate at pH 3-5 in an excess of sodium oxalate. It is proposed to separate Ga and In by precipitating indium with sodium diethyldithiocarbamate or extracting it with ethyl acetate at pH 3-5 in an excess of sodium oxalate. Experimental error for In and Ga is 1-3% at a In/Ga ratio from 2:1 to 1:10. The results of Ga and In separation by precipitation are shown in Table 10.

Separation of In and Ga by extraction is illustrated by data shown in Table 11. There are 11 tables; and 35 references, 8 U.S., 3 U.K., 14 German, 1 Japanese,

PERIODICAL: Tr. Leningr. tekhnol. in-ta im. Lensoveta, 1957, Nr 42,
pp 55-62

ABSTRACT: In experiments conducted with mixtures based on various types of India rubber the authors confirm that the heating of rubber subjected to stretching causes it initially to decrease in length (i.e., causes its modulus of extensibility to increase), but thereafter to increase in length---often very markedly (its modulus of extensibility then decreasing), until the rubber fails.

TITLE: Some Common Regularities in the Daily Variations of the Earth's Magnetic Field Established by Soviet Polar Observatories
(Nekotoryye obshchiye zakonomernosti sutochnykh variatsiy magnitnogo polya zemli po dannym Sovetskikh polyarnykh observatoriyy)

PERIODICAL: Trudy Nauchno-issledovatel'skogo instituta zemnogo magnetizma, ionosfery i rasprostraneniya radiovoln, 1957, Nr 12 (22), pp. 73-85 (USSR)

ABSTRACT: To analyze a very complicated pattern of magnetic variations in polar regions, long-range observations were studied in regard to declination (D), horizontal component (H), vertical component (Z), and the variations of total force (δF). The study covered both quiet and disturbed days, grouped into clusters of summer, winter and equinoctial observations. For quiet days the pattern of variations was steady, with only the amplitudes varying. This steady

Some Common Regularities in the Daily Variations (Con't)

37-124/10

pattern was, as a rule, sustained even on disturbed days, but some phenomena differed from those observed on quiet days, e.g., it was found that on the days of minimum magnetic activity (quiet days), a twin wave appeared which was not seen on days of maximum magnetic activity. The article examines the relationship between magnetic amplitudes and solar and magnetic activities, as observed in moderate latitudes. This relationship is reduced to the following formula: $A = A_0 + \delta W$, in which A is the amplitude of magnetic vibrations and W the index of solar activity (equal to the relative number of sun spots). It was found that W , characterizing mainly the short wave (ultraviolet radiation), has no bearing on corpuscular radiation. The best tool for evaluating objectively magnetic amplitudes on disturbed days is the so-called K index, which is calculated from 3-hour intervals (universal time). It was established that the amplitudes of magnetic values grow with latitude, but start to decrease at a certain distance from the pole. In high latitudes, the shape of the distributive curve was found to be of the parabolic type with the apex lying close to 70° latitude. This dependence on latitude is analyzed for quiet and disturbed days, and for the indices concerned

TITLE: Practical Application of Vertical Component Variations Instead
of Variation of the Total Force of the Earth's Magnetic Field
(O vozmozhnosti prakticheskogo primeneniya variatsiy vertikal'noy
sostavlyayushchey zemnogo magnitnogo polya vместо variatsiy polnoy
sily)

PERIODICAL: Trudy Nauchno-issledovatel'skogo instituta zemnogo magnetizma,
ionosfery i rasprostraneniya radiowолн, 1971, № 12 (22),
pp. 86-90 (USSR)

ABSTRACT: Airborne magnetometers measuring the total force (F) of the earth's magnetic field use new permalloy parts which facilitate precision measurements with ± 5 gamma limit of errors. Due to such great precision, the control of variations (δF) is necessary. With variations of δD , δH , and δZ measured in magnetic observatories, the calculation of the variation of total force is done by means of the following formula: $\delta F = \delta Z \sin I + \delta H \cos I$ (in which I is the inclination). Since such calculations take

Card 1/2

Practical Application of Vertical Component Variations

37-12-5/12

much time, the question arose as to the permissibility of substituting δZ by δF and the magnitude of the error. As seen from the enclosed graphs and tables, the error of substitution in polar regions on quiet days is, on the average, not greater than ± 5 gammas; however, on disturbed days, in areas of very high longitude, the error might exceed ± 5 gammas. A. A. Logachev is mentioned. There are 3 figures, 3 tables and 1 Russian reference.

engaged in geological and geophysical exploration, as well as university students and personnel of scientific research institutes doing research in the field of petroleum.

COVERAGE:
 The 4th volume of the Trudy (Transactions) of the Azerbaydzhhan Scientific Research Institute of Oil Production includes articles on new findings in the micro-fauna of Miocene and Cretaceous beds of Eastern Azerbaydzhhan, and, published for the first time, the original findings on spore-pollen analysis of Barremian beds. In Part II, the new litho-facies study of separate stratigraphic units of the Tertiary complex is presented. New ways in research are revealed, which are based on thermal, roentgenological and staining methods in the classification and correlation of geological cross-sections. The results of reservoir studies for some oil pools of the Pliocene period in the Azerbaydzhhan SSR are submitted. The geophysical part, dedicated to interpretation and findings, contains articles on new electrokinetic seismographs, published

TITLE: Microfauna of the Jurassic Deposits in the Ulluchay
(Central Dagestan) Section Mikrofauna yurskikh
otlozheniy razreza Ulluchay (tsentral'nyy Dagestan)--
in Azerbaydzhan/

PERIODICAL: Dokl. AN AzSSR, 1956, Vol 12, Nr 1, pp 9-14

ABSTRACT: In the section at the Ulluchay River, the upper Aalenian
is composed of a succession of argillaceous shales
containing sandstones and aleurites with streaks of
limestones. The macrofauna consists of pelecypods and
ammonites. The foraminifera are characterized by a
great variety of species: Cristellaria, Nodosaria,
Marginulina, Dentalina, Spirophthalmidium and others;
the ostracoda are rare and are represented by new
species. The Bajocian is made up of a succession of
lime-free clays with sandstones. The foraminifera

belong mainly to the lagenidae family; isolated species belong
to ophthalmidiidae, polymorphidae, lituolidae and epistominidae.
The Bajocian group of foraminifera differs considerably from
the upper Aalenian. The author compares these groups with the
foraminifera in deposits of the same age occurring in other
regions of the Caucasus, the Russian Platform and Western
Europe. A bibliography of 17 titles is given.

Abstract : During 11 years 220 cases of recurrent carcinoma of the uterine cervix were observed (118 after surgery and 102 after radiation therapy). The greatest number of recurrences (68.5 percent) was found during the 1st year after extensive abdominal surgery. Radiation therapy is the sole method of treatment of recurrences. The concurrent use of supporting measures is necessary. -- I.D. Nechayeva.

PERIODICAL:

Svarochnoye Proizvodstvo, 1958, Nr 1, pp 34 - 36 (USSR)

ABSTRACT:

The quantity of the alpha-phase in austenitic metal seams determines the resistance of seams to the formation of heat cracks and has a decisive influence on mechanical and corrosion properties. Investigations conducted by TsNIITMASH established optimum limits of the alpha-phase percentage of austenitic seams in the welding of fire-proof steels. Methods of etching the slides were developed to detect the phase. The author names one of the best reagents for detecting the phase in slides etching, which has the following composition: 10 gr of potassium ferricyanide, 10 gr of caustic soda and 100 gr of water. The quantitative determination of the phase in metallographic investigations must be carried out with a magnification factor on the order of 1,000. The alpha phase quantity is computed as a mean value

Card 1/2

The Quantitative Determination by Metallographic Methods of the Alpha-Phase
in Austenitic Seam Metal.

135-58-1-14/23

from five estimates made in different spots of the investigated surface, in view of the irregular distribution of the phase in austenitic metal of the seam. It is often necessary to also determine the eudritic structure of the seam metal and the limits of its welding with the basic metal. For this purpose it is recommended to apply electrolytic etching in a 15 % aqueous solution of chromic anhydride. There are 3 photos.

TITLE : On Beidellite Clays of Tortonian in the Pre-Carpathian Saline Formation (Petrographic Analysis)

ORIG. PUB. : Kwart. geol., 1958, 2, No 2, 287-310, 463-465

ABSTRACT : Microscopic, mechanical, x-ray diffraction, and differential thermic methods, as well as staining with organic dyestuffs, were used to study samples of clayey capping of the salt deposit. The principal minerals are beidellite and hydrous micas, which indicate precipitation in weakly alkaline and reducing medium. Results of chemical analysis, recomputed for the mineralogical composition, are given. -- G. Vorob'yev.

TITLE: Production Flow Lines for Bushings and Bracket Insulators
(Potochnyye linii proizvodstva prokhnodnykh i opornykh
izolyatorov)

PERIODICAL: Vestnik Elektropromyshlennosti, 1959, Nr 4, pp 12-16 (USSR)

ABSTRACT: Flow lines for bushing and bracket insulator production have been installed at a number of insulator works but they do not cover the whole process of manufacture and usually terminate at the turning process. The production lines described in this article use belt conveyors along which the various machines and ovens are located; the lines are illustrated in Fig 1. The raw material is delivered on a conveyor, it is then extruded and the parts are cut to length and immediately turned on lathes. They are then conveyed to the drying ovens. The dried insulators are inspected for cracks and moisture content. The glazing procedures are somewhat different for insulators and bushings but both operations are served by the conveyor belt. A photograph of the production lines is given in Fig 2 and the bushing glazing section is shown in Fig 3.

Card 1/2

Production Flow Lines for Bushings and Bracket Insulators
SOV/110-59-4-4/23

Available conveyor type ovens are only suitable for drying times of the order of 4 hours and are, therefore, not suitable for high voltage insulators that require 24 hours drying time. It was, therefore, decided to construct three such conveyors in series to form a single unit. The modifications that were required to the ovens are described. Steam injection was used to retard the initial rate of the drying. Hitherto, some types of insulators have been turned in two operations which have now been combined into one. The procedure is illustrated diagrammatically in Fig 4 and is explained.

TITLE: Mechanised Flow Lines for the Manufacture of Telephone
and Telegraph Insulators

PERIODICAL: Vestnik elektropromyshlennosti, 1959, № 9, pp 28-30 (USSR)

ABSTRACT: The usual methods of manufacturing small telephone and other insulators involves the use of gypsum moulds and is very laborious. The first step in mechanisation is to use metal moulds, which were first introduced in the Tokarovskiy Works in 1957. A semi-automatic moulding machine is now in use with telescopic metallic moulds. The machine and moulds are operated by compressed air at a pressure of 4 atm. The inner part of the moulding tool rotates first in one direction, then in the other, and cuts a thread in the insulator. The outer part of the tool rotates in one direction only. The tool moves backwards and forwards as well as rotating. This semi-automatic moulding machine can produce up to 4000 insulators a shift. In addition to this machine there is a pneumatically-operated trimming lathe of the same output. Waste clay from the moulding and trimming machines is immediately returned to the vacuum press on the return half of the

Card 1/2

SOV/110-59-9-8/22

Mechanised Flow Lines for the Manufacture of Telephone and Telegraph Insulators

conveyor belt. Thus the scrap pieces are always quickly used and do not have time to become dry or dirty. Thuringia-type conveyor driers 19 metres long are used to dry the insulators. The insulators are glazed on semi-automatic roundabout machines illustrated in Fig 2; the principles of operation are briefly described. As will be seen from the general illustration of the flow line given in Fig 3, all the work is handled on conveyors. The introduction of mechanisation has cut production time by two days and only a third of the former number of workers is required. Immediate and continuous use of scrap clay without re-milling has cut consumption by a factor of 1.2. There are 3 figures and 2 Soviet references.

BRISENKO, V.K., inzh.; MOROZENKO, V.Ya., inzh.

Continuous line for the production of porcelaine used in electric
equipment. Vest.elektroprom. 31 no.1:58-59 Ja '60.

(Assembly-line methods) (Porcelain)

(MIRA 13:5)

APPROVED FOR RELEASE: 06/19/2000

CIA-RDP86-00513R000928230001-6"

KUKOLEV, G.V.; KUZNICHENKO, A.N.

Raising the turnover of refractory supply in the manufacture
of insulators. Izv. vys. usheb. zav.; khim. i khim. tekhn. 8
no.3:522-524 '65. (MTRN 18:10)

I. Khar'kovskiy politekhnicheskiy institut imeni Lenina,
kafedra keramiki i ogneuporov.

KUZNICHENKO, A.P.; ARTASEVICH, L.A.

Device for continuous controlling of moisture in the porcelain batch.
Stek.i ker. 17 no.3:36-37 Mr '60. (MIRA 13:6)
(Porcelain)

KUZNICHENKO, A.P., inzh.

Peculiarities of the procedure for manufacturing rod insulators.
Stek. i ker. 20 no.10:29-30 O '63. (MIRA 16:10)

1. Slavyanskiy keramiko-izolyatornyy kombinat.
(Electric insulators and insulation)

KUZNICKA, Barbara

Meeting of Warsaw scientific workers of the Institute of
Science and Technology of the Polish Academy of Sciences,
Kwart hist nauki i tech 9 no. 2: 338 '64.

KUZNICKA, Barbara

Problem of periods of the history of pharmacy. Farmacoja
Pol. 20 no. 11/12:439-444 25 Je '64.

Title : Remarks of the Changes in Teaching

Orig Pub : Biol. szkole, 1956, 9, No 3, 24-27

Abstract : The remarks concern the Instructions for the biology program for pedagogical personnel for the 1955/1956 school year. It points out the difficulties which arise in the implementation of new programs while they are provisional, which hinder systematic training.

Title : The Investigation of the Absorption Spectra of Hydro- and
Oxy-Cellulose in Infrared-Rays.

Orig Pub: Przem wlokienniczy, 1956, 10, No 12, Bull Inst wlokienn-
ictwa, 23-24.

Abstract: Describes the advantages of a spectral chemical analysis
of cellulose by the determination of the degree of decompo-
sition of the cellulose and the formation of oxy- and
hydrocellulose.
