TITLE: Medical scientific-research and therapeutic centers in North
Vietnam

SOURCE: Wiadomości parazytologiczne, no. 5, 1965, 499-504

TOPIC TAGS: medical personnel, medical facility, medical research, naval medicine, medicine, bacterial disease, infective disease, disease control, epidemiology, health service

ABSTRACT: Five persons, including the authors and Dr. C. Zwierz, spent three months in North Vietnam. Their mission was to study the organization of the North Vietnam Health Service, the scientific-research and therapeutic centers, and the epidemiology of the country, as well as to establish contacts with the Vietnamese medical institutions. The team visited the Institute of Malaria, Parasitology, and Entomology in Hanoi headed by Dr. Dang van Ngu, the University of Hanoi, the Institute of Trachoma and Eye Diseases in Hanoi, the Institute of Epidemiology and

Hygiene in Hanoi, the Institute of Traditional Medicine, the Institute of Pharmacology, and the Institute of Tuberculosis headed by Dr. Pham Ngoc Thach, who is also the Minister of Health. The Polish team visited also the Bach Mai Hospital and the Vietnam-Soviet Friendship Hospital in Hanoi, the Vietnam-Czechoslovak Friendship Hospital in Hai Phong where Dr. Phanth Trinth conducts research in histopathology of ascaridiasis, hospitals in Thai Nguyen and Vinh, a village hospital in the district of Dien Chao, and a hospital for lepers in Quynh Lap. The prevailing diseases in North Vietnam are malaria, filariasis, ascaridiasis, amebiasis, and ancylostomiasis.

ORIG. PUB. : Koks, Smole, 1958, 3, No 3, 85-92

ABSTRACT : Developed is the synthesis of alkylsulfonates—
surface-active substances of the "mekaley" type.
Filtered anthracene oil, products of its refining,
enriched with phenanthrene, raw phenanthrene and
fusil oils are used as raw materials. In the fol-
lowing example, synthesis conducted in the obtain-
ment of one of the surface-active substances, de-
noted as AAS-II, is described. To a mixture com-
pound of 25 gr of pure phenanthrene and 25 gr of
**-Active Substances.

TITLE: Contribution to investigation on the mechanism of magnetization reversal in ferrites

PERIODICAL: Archiwum elektrotechniki, v. 10, no. 1, 1961, 281-294

TEXT: This paper provides an analysis of the experimental results carried out on a toroidal core made of the ferrite of type $Mn_{0.556}$

$Mg_{0.608}Fe_{1.845}O_4$. The method was based on plotting the family of hysteresis loops for the material by taking the static measurements carried out by ballistic method and then subjecting the core to a pulsating magnetic field. The precautions taken during the experiments, and the methods of obtaining the results which are then analyzed are described. It is concluded that the hysteresis loops obtained under dynamic magnetization conditions are wider and more rectangular than the static ones; the switching time depends on the field strength and the initial magnetic state of the material

AUTHORS: Markowski, Janusz; Lachowicz, Henryk

TITLE: Equipment measuring impulse parameters of ferrite memory cores

PERIODICAL: Przeglad Telekomunikacyjny, no. 4, 1961, 113-118

TEXT: The article describes and defines impulse parameters denoting the properties of ferrite cores designated to operate as elements in a memory digital computer. In addition, equipment used to measure the above parameters, its operating principles, as well as the measuring method is described. A number of principle elements of the measuring apparatus are illustrated in a number of figures. The measuring equipment may be used to measure the parameters of ferrite toroidal cores with rectangular hysteresis loop. Among the basic requirements placed on ferrite cores with rectangular hysteresis loop is the ability to register information and to facilitate a non-distorted reading. The ferrite cores in memory digital computer are subjected to the action of integral impulses, which should change the magnetic properties of the core and impulses with lower amplitude. The above requirements determine the necessary shape of hysteresis loop material as well as the coefficients characterizing the shape of B/H core

Card 1/4

dependance i.e. a) the coefficient of primary remanence - s

$$S = \frac{B_r}{B_m}$$

b) the coefficient of fixed remanence - p

$$P = \frac{B_{ru}}{B_m}$$

c) the coefficient of partial de-magnetization

$$V = \frac{B_p}{B_m}$$

where B_m - value of maximum induction answering the applied field H_m ; B_r - induction value of primary remanence; B_{ru} - induction value of fixed remanence after adequate number of fragmentary impulses; B_p - induction value answering fragmentary impulse $1/2 H_m$. The above coefficients are the functions of coercitive magnetic force H_m . Values of the above coefficients have great significance in determining the usefulness of a given material selected for the production of memory cores, where in determining the operating condition of a

Equipment measuring impulse parameters ...

ferrite core the voltage values during reading are the most important. One additional coefficient defining the properties of ferrite core with rectangular hysteresis loop is the impulse duration. Measurements of given magnitudes characterizing the properties of a given core are made on the synchroscope screen. The investigated core is magnetized with a sequence of impulses. The number of fragmentary impulses in a sequence may be regulated from 1 to 15, their amplitude and width in the range from $2 - 8 \mu$ sec. Due to the action of the magnetic field on the investigated core, a voltage is induced which, applied to the vertical amplifier of the synchroscope, is made visible on the screen so that course and amplitude of each impulse can be measured. In order to measure the parameters defining the shape of hysteresis loop and the value of induction, the voltage induced on the core wiring is subjected to integration in a Miller integrating circuit. This results in that a coarse proportional to induction changes in the core is obtained. Due to the great amplitude of the current required for the measurements a transformer with a ratio of $p = 1 : 10$ was used. A non-stable multi-vibrator synchronized the operation of the impulse generator. The multi-vibrator operates as an asymmetrical unit on 20 cps frequency generating impulses in the length of 5μ sec. As a cathode repeater, an ECC3 81 tube was used, for which cathode pressure of $R = 100 \text{ k}\Omega$ and an amplitude of $k_u = 0.982$

Card 3/4

V/V was obtained. Condensors C_1 and C_2 were charged through inter-pressure of the diode D_1 and exit pressure of the repeater. A ECC 81 tube, with a grid connected to anode, was used as diode and its internal pressure reached about 300 Ω . There are 12 figures and 2 Soviet-bloc references.

TITLE: Thin ferromagnetic films and their applications in mathematical machines

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 6, 1962, abstract 6-1-55 b (Przegl. elektron., 1961, 2, no. 4, 309-330)

TEXT: A thin magnetic film is a layer of ferromagnetic material of up to several angstroms thickness applied in a suitable way to a base of nonmagnetic, usually insulating, material. The investigation of thin films is of great importance, because these can be used as memory elements in digital computers. Two methods of preparing thin ferromagnetic films are described: evaporation in vacuum and electrolytic coating. Films for memory elements are usually made of Ni and Fe alloys, from 85 % Ni and 15 % Fe to 55 % Ni and 45 % Fe. The thickness of the layer can vary between 2000 - 3000 Å. The method of electrolytic coating is considerably simpler and does not require such complex apparatus as the method of vacuum evapora-

tion. Various investigations into, and methods of preparation of thin films not only of the usual materials, but also of precious metals (gold, platinum, silver, etc.) are described. The properties of thin magnetic films of different materials are described in detail. The relationship between the induction and the magnetic field intensity is discussed. The dynamic properties of thin films are of great importance when these are used in memory units (and also as switching elements). The essential parameter is the time taken for switching the film. This time interval is defined from the instant when the flux \emptyset reaches 10 % to the instant when it is 90 % of \emptyset_{max} under the influence of a fast rising impulse of switching field. Detailed investigations are carried out into these values for rectangular and cylindrical film spots. Investigations into the influence of mechanical stress and magnetizing field on the magnetic properties are described, and a number of examples are given for the use of thin films as memory elements. 16 figures and 44 references. of variations of the field amplitude on the shape of the hysteresis
loop and concluded that the field rise rate is responsible for the
variations in the loop shape. The triangular waveform was used to
separate the effects of amplitude magnitude and the rate of rise.

which changes in magnetization are expressed in the motion of a single domain wall. When the field h is a linear time function $h = k_1 \cdot t$, then $\frac{dh}{dt} = aA(k_1 \cdot t - H_0)$ for $\frac{H_0}{k_1} < t < \frac{H_s}{k_1}$ where a, A are constants, H_0 - threshold field for the domain wall motion, H_s = saturation field, k_1 - field rate of rise. For two arbitrarily chosen rates of rise k_1 and k_2 the equation is obtained

$$\left(\frac{H_{s1} - H_0}{k_1} \right)^2 \frac{aAk_1}{2} = \left(\frac{H_{s2} - H_0}{k_2} \right)^2 \frac{aAk_2}{2}$$

becomes $(H_{s1} - H_0)^2 \cdot k_2 = (H_{s2} - H_0)^2 \cdot k_1$ (3)

showing the dependence of the saturation field on the field rise rate. Experimental results did not exhibit discontinuity which might be theoretically expected for a magnetizing field H_o , which might be due to magnetization rotation and /or different values of H_o in various core regions. Discontinuity at $h = H_s$ was also absent, probably because of the rotation in the direction of the applied field. Linear approximation of experimental processes is used in deriving the dependence of the coercivity on the field rate of rise and

$$2 \log (H_c - H_o) = \log k_1 + \log \left(\frac{\Phi}{k_a} \right) \quad (7)$$

where H_c is the coercivity and k_a is the slope of the response. The time taken for the remagnetization is inversely proportional to the square root of the field rate of rise. Results obtained in experi-

TITLE: Apparatus for the display of hysteresis loops in thin magnetic films

PERIODICAL: Archiwum Elektrotechniki, v. 11, no. 4, 1962, 823-827

TEXT: An apparatus is described which serves for the study of hysteresis loops in cylindrical and plane thin films. A triangular magnetic field is applied in order to avoid the distorting effect of the varying rate of rise occurring with sinusoidal fields. The operating principle is that presented by Crittender (Rev. Sci. Instrum., v. 22, 1951, 872), with the integrated vol. of the test winding and voltage proportional to the field applied to deflecting plates of a cathode ray tube. When the display is properly calibrated, direct measurement of hysteresis loop parameters is possible. A block diagram and photographs of the instrument and of the test coils are given. The triangular waveform is obtained by integrating a square waveform, the amplitude being controlled by adjustment of

Card 1/2

Apparatus for the ...

the pulse repetition frequency. The test coils consist of magnetizing, reading and compensating windings. Frequency can be varied between 0.5 and 12.5 kc/s. A Miller integrator with a time constant of 0.24 sec is used in the display amplifier. The vertical deflection on the screen is calibrated by means of a simulator circuit supplying rectangular pulses of known amplitude and duration. Some loop oscilloscopes are given. There are 8 figures.

TITLE: Hysteresis loop tester for investigating thin magnetic films

PERIODICAL: Przeglad elektroniki, no. 12, 1963, 722 - 729

TEXT: The equipment described was designed for the measurement of the parameters of hysteresis loops of thin, cylindrical and flat layers of magnetic materials. The system employs a triangular magnetizing-field wave-form rather than the standard sinusoidal field. It consists of five basic units: magnetizing-field generator; measurement coils; integrating amplifier; simulator and an oscilloscope. A set of suitable power supplies is also provided. The underlying principle of the equipment is analogous to that proposed by Crittenden et al (Rev. Sci. Instrum., 22, 1951, 872). The field induced by the investigated layer in the reading coil is integrated in order to obtain a wave-form whose amplitude is proportional to the changes in the induction flux. The hysteresis loop of the magnetic layer is obtained on the screen of the oscilloscope by applying the integrated wave-form to the Card 1/3

Hysteresis loop

P/053/62/000/012/010/011

vertical deflection plates and a signal, proportional to the magnetizing field, to the horizontal deflection plates. The simulator provides a known amplitude signal whose shape is near to that of the response of the magnetic layer; the simulator is used for calibrating the vertical axis of the oscilloscope. The magnetizing-field generator produces a triangular wave-form of maximum amplitude 1.5 A and a nonlinearity of less than 5%. The repetition frequency of the wave-form can be varied from 0.5 to 12.5 kc/s. The measurement coils for investigation of the cylindrical layers are illustrated in Fig. 5, where 1 is the glass former of the control coil, 2 is the reading coil, 3 is a control winding, 4 is a compensating coil and 5 is a movable internal core. The lower cut-off frequency of the integrating amplifier is 2 c.p.s., and its upper limit frequency is 200 kc/s. The oscilloscope is based on a standard circuit and has a flat screen of 13 cm diameter. There are 9 figures.

TITLE: Transistorized equipment for investigating the hysteresis loops of thin magnetic samples

PERIODICAL: Przeglad elektroniki, no. 12, 1963, 730 - 738

TEXT: The equipment is designed for investigation of hysteresis loops of cylindrical and flat magnetic samples. A magnetizing field of constant rate of rise is used for this purpose. Measurement of the parameters of the samples is carried out on the screen of an oscilloscope which traces the hysteresis loop of the sample. The equipment comprises a magnetizing-field generator which produces a triangular magnetizing wave-form. It also contains an integrating amplifier for the vertical deflection plates of the oscilloscope and a metering device for measuring the coercive force. The most important unit of the equipment is a system of measurement coils which is illustrated in Fig. 5. It was necessary to use two pairs of coils to eliminate the interference fields. The voltage induced in each of these is proportional to the rate of rise of the field. The voltages of the two pairs are applied to Card 1/4

Transistorized equipment

P/053/62/000/012/011/011
E192/E382

independent pre-amplifiers and the necessary degree of compensation is achieved by adding the two voltages in antiphase in the common stage. Each pair of reading and compensating coils has 1 000 turns. On the other hand, coils of both pairs, which are situated away from the centre of symmetry, have about 10% more turns. Basket-type winding is adopted to reduce their self-capacitances. The magnetizing coils are of the Helmholtz type in order to achieve a good field uniformity. The magnetizing-field generator employs an OC 35 transistor in its input stage and this produces a maximum field amplitude of 8 Oe. The integrating amplifier for the vertical deflection plates is fully transistorized and is provided with a special mains compensating circuit to eliminate interference due to the mains. The fact that the instantaneous value of the magnetizing wave-form is proportional to time can be used for measuring the coercive force of the magnetic material. The pulses generated in the measuring coils are near in shape to an isosceles triangle. Half the value of the integral of such a wave-form is proportional to the coercive force and this is attained at the same instant as the

Card 2/4

P/055/62/000/012/011/011
E192/E382

Transistorized equipment

maximum value of the pulses. The coercive force is therefore proportional to the time measured from the zero value of the magnetizing field to the maximum value of the first following pulse. A transistorized circuit terminated with an indicator meter was designed and built for this purpose. The work described was carried out at the Computer Laboratory of Manchester University Electrical Department.

TOPIC TAGS: memory core, memory core tester, computer component, data storage element, memory device, pulse sequence testing, magnetising pulse sequence testing, magnetic reversal testing

ABSTRACT: The article describes the operation of the titled memory core tester. In comparison with a number of earlier devices, it is primarily characterized by a high degree of universality. This pertains to the selection of a magnetizing sequence which can be fixed in a practically arbitrary manner both with respect to polarization and amplitude of the sequential pulses. The maximum number of pulses per sequence is eight. This device can be widely used in laboratories conducting research on memory cores or in centers utilizing these cores in computer memory or logic circuits. The device can also be helpful in investigating the basic phenomena

TITLE: Some properties of polycrystalline ferromagnetics magnetized by a linearly increasing field

SOURCE: Archiwum elektrotechniki, v. 15, no. 1, 1966, 191-198

TOPIC TAGS: ferromagnetic material, polycrystal, hysteresis loop, magnetization

ABSTRACT: Some properties of polycrystalline ferromagnetics with a rectangular hysteresis loop influenced by linearly increasing magnetizing field have been investigated. The remagnetization model proposed by the author is based on the assumption that the process occurs by irreversible displacements of Bloch's walls. Consequently, there is obtained the following relation determining the remagnetization time of the material: $\tau_s = \sqrt{2\langle d \rangle / R \cdot k}$, where $\langle d \rangle$ is the mean length of displacement of the walls for the whole process, R is the mobility of the moving walls and $k = dH/dt$. The influence of the ring-core dimensions on the characteristics $s = f(k)$ has been determined. Measurements of these characteristics for an Mn-Mg-Zn ferrite

Card 1/2

TOPIC TAGS: thin magnetic film, thin ferromagnetic film, permalloy, magnetization, magnetization reversal

ABSTRACT: A model of magnetization reversal by the domain wall movement was proposed and consists of an anisotropic thin film sample which is a polycrystalline square-loop ferromagnet magnetized in the easy direction by a magnetic field increasing linearly with time. The switching time and dynamic coercivity of the material are expressed as functions of the rate of increase of the field. The calcula-

* [Probable error. Possibly Warsaw is meant]

Card 1/2

L 45320-66

ACC NR: AP6024350

tions are based on the expression for the velocity of a domain wall obtained from the well-known Landau-Lifshits equation. Experimental results for thin permalloy films are in good agreement with theoretical predictions. A practical aspect of this work is a new method of determining the coercivity state of the material. The experiments also show that even under conditions in which a uniform rotation is expected to occur, domain wall motion is the result which allows a magnetization change to take place. Orig. art. has: 6 figures, 17 formulas. [GC]

The incidence of Esch. coli types O111 B4 and O55 B5 in
infantile diarrhoea's. MED.DOSW. MIKROBOL. 1955, 7/3 (331-342)
Investigations on the presence of Esch. coli types O111 B4 and O55 B5 were carried
out on 145 diarrhoeal infants, 159 hospital controls, 89 healthy controls and 159
adults. All cases were hospitalized in a paediatric clinic at Gdańsk. All healthy
infants and adults belonged to the population of Gdańsk. Samples of faeces were
taken by means of rectal swabs. As a rule 10 coliform colonies were isolated from
every culture of faeces and slide agglutination was carried out with OB sera.
Flagellar antigens were not determined. Esch. coli type O111 B4 was found in faeces
of 35, 5%, 10, 2, 1, 03 and 0, 88% and Esch. coli type O55 B5 in 11, 71, 4, 42, 1, 01 and 0%
of persons belonging to the groups mentioned above. Type O111 B4 was demonstrated
in samples of blood of 6 diarrhoeal infants. Both types were rather frequently found
in samples of blood of 6 diarrhoeal infants. Both types were rather frequently found
post mortem, particularly in mesenteric lymph nodes (18% of type O111 B4 and 5%
of type O55 B5) and only exceptionally in other material (urine, mucus, middle ear
exudate). 227 strains of O111 B4 type were tested biochemically. 209 of them were
nitrate. Forty-three strains of O55 B5 type were studied biochemically, and 24 of
them did not ferment maltose. None of 98 strains investigated (of both types) pro-
duced haemolysin. The results were discussed and were believed to be consistent
with the view that both types play an aetiological role in infantile diarrhoeas.

Title : Phage-Identification of Typhoid Bacteria as
a Method of Epidemiological Investigation.
Orig Pub : Przegl. epidemiol., 1957, 11, No. 3, 269-280
Abstract : The value and significance is demonstrated of
a method of phago-identification during typh-
oid in spite of several factors which can pre-
vent a correct evaluation of the epidemiolog-
ical situation. The phenomenon of changeab-
ility is one of these factors. Of special

value are: 1) loss by bacteria of Vi-antigen
without which the adsorption of Vi-phage into
the bacterial cell is not possible and 2) the
degree of degradation of the strain during
which the lysis of the cells occurs not only
in the presence of a specific bacteriophage,
but also of other related and nonrelated
phages. The latter type of changeability is
met most often and leads to the change of
the phagotype. Thus, during multiple iden-
tification of strains isolated from patients
and carriers (1947-1949), similar results
were obtained in 15.3% of the cases; in 10%
of them, the phenomena of changeability was
