Budapest, A MTA Biologialai es Orvosi Tudomanyok Osztalyanak Kozlemenyei, Vol 13, No 4, 1962; pp 345-363.

Abstract: [Authors' Hungarian summary modified] Authors studied the electron-microscopic morphology of untreated NK/Ly ascites lymphoma cells and those treated with various chemotherapeutic agents. Untreated cells have a diameter of between 10 and 20 microns; they have two or more nucleoli and possess well-developed Golgi apparatus. Cells treated with Degrarol or Amoxan increase in size within hours after exposure to the drugs; there is an appearance of virus-like bodies in the Golgi zones, but in general the alterations produced by the chemotherapeutic treatment are not too different from those caused by other drugs.

*B*TITLE: Electronmicroscopic examination of KB cell cultures infected with adenovirus
type 12*b*SOURCE: Academia scientiarum hungaricae. Acta microbiologica, v. 12, no. 3, 1965,
241-259TOPIC TAGS: virus, enzyme, cytoplasm, electron density, RNA, DNA, cytology,
microscopy, electron microscope, pathology, virology

ABSTRACT: Infection of KB cells with adenovirus type 12 resulted in the appearance, in the nucleus, of a substance characterized by the absence of nucleic acids, a resistance of pepsin digestion, osmophilia and high electron density. The amount of this substance increased rapidly; in 36-48 hours it formed a coherent reticular pattern covering the total nucleus. In certain areas hexagonal, crystal-like structures appeared. The neighborhood of the above reticulum was successively filled by virus particles until virus crystals of variable sizes were formed. In some preparations the entire nucleus was filled with viruses. One or more viruses, at times even complete virus crystals appeared in the cytoplasm parallel to the progress of cell damage. The average diameter of an individual virus was 70 m μ as measured on ultra-thin cell sections embedded in Epon. The round and ovoid viruses comprised a central, *Cord 1/2*

ACC NR: AP6020275

2

osmophilic and electron-dense part (nucleoid) surrounded by a less dense viroplasm with distinct borders. The nucleoid was sensitive to DNase and resistant to RNase. Treatment with pepsin resulted in the digestion of all visible constituents but the nucleoid. The formation of a highly organized, rich membrane pattern could occasionally be observed in the cytoplasm of infected cells. Aspecific degenerative changes elicited by the infection were also observed. The cytopathological changes induced by adenovirus type 12 resembled mostly those elicited by type 5 of the same agent. The present study was carried out at the Institut de Recherches sur le Cancer, Villejuif, France on a one-year fellowship grant from the UICC. The tissue cultures used were supplied by the Department of Virology (Dr. P. Tournier) of the Institut de Recherches sur le Cancer. The author is indebted to Dr. W. Bernhard and Dr. P. Tournier and to the UICC for their valuable help. Orig. art. has: 13 figures and 2 tables. [Orig. art. in Eng.] [JPRS]

TITLE: Removal of Furnace Scale from the Surface of Rolled Sheet by the Steam-gas Explosive Method (Udalenije pechnoj okaliny s poverkhnosti prokatyyayemogo lista paro-gazovzryvnym sposobom)

PERIODICAL: Metallurg, 1958, Nr 6, pp 29 - 30 (USSR)

ABSTRACT: Since 1957, furnace scale at the sheet mill of the Stalinsk Works has been successfully removed by using a middle roll with cavities in its surface, according to practice developed at the Kuznetsk Metallurgical Combine. The rapid evaporation of water in the confined space formed by the cavity and the hot surface being rolled blasts away scale. The authors state that the method has proved effective with almost all types of steel, has led to improved surface quality and reduced the amount of additional surface treatment. The cavities are oval (46 x 26 mm) and are arranged in a staggered pattern, with centre-to-centre distances in a given row being 92 and the inter-row distance 45 mm (Figure 2). Initially, the cavities are 6.5 - 7 mm deep. Cast iron and molybdenum, were found to be more durable than steel rolls.

Use of Tetraethyl Lead as a Component of the Catalyst for
Low-pressure Ethylene Polymerization

PERIODICAL: Plasticheskiye massy, 1960, No. 11, p. 3

TEXT: The authors studied the possibility of using tetraethyl lead for ethylene polymerization. It was found that polyethylene can be obtained in the presence of a catalyst consisting of tetraethyl lead and titanium tetrachloride. Polymerization was conducted both at atmospheric pressure and in an autoclave at low pressure. The use of a certain pressure favored a more active course of the process, and increased the yield. The polyethylene was eluted with alcohol, with alcohol saturated with hydrogen chloride, and with a mixture of alcohol and aqueous solution of ammonium acetate. The result was a snow-white polymer containing no tetraethyl lead nor any other alkyl-containing lead compounds. The melting point of the resulting polyethylene is 125° - 127° C. The viscosity of a 1% decalin

TITLE:

Determination of Small Amounts of Hydrogen in Helium

PERIODICAL:

Zavodskaya laboratoriya, 1960, Vol. 26, No. 9,
pp. 1082 - 1083

TEXT: A method of determining hydrogen in helium according to the absorption development chromatography was elaborated. The experiments were made on a XT-2M (KhT-2M) chromatographic instrument with a developer based on the thermochemical principle (Ref. 1). The working conditions were selected in such a way that a detector could determine both components by two characteristics, i.e., helium by the thermal conductivity and hydrogen by the heat of combustion. A 6 m long metallic separation column, filled with CKT (SKT) coal and with air as carrier gas, was used for analyses at room temperature. The sensitivity to hydrogen amounted to 0.5% at a relative accuracy of 5%. A 10 m long polyvinyl chloride tube was used for analyses at low temperatures and work was carried out

SOURCE: Ufa. Bashkirskiy nauchno-issled. institut po pererabotke nefti. Trudy*, no. 6, 1963. Sernisty*ye nefti i produkty* ikh pererabotki, 186-194.

TOPIC TAGS: acetylene, acetylene production, butane pyrolysis, tubular furnace design, pyrolysis.

ABSTRACT: The optimum conditions were investigated for pyrolysing butane to acetylene in a tubular furnace in the installation shown in a figure. Modifications are suggested, such as the use of Kh25T (instead of 1Kh18N9T) nipples on the burners, and the addition of collector-type plates in the cooling apparatus. Optimum raw material: water vapor ratio is 1 : 2.2-2.4, lower ratio causing coking. The dependence of coking on pyrolysis and on preheating temperatures is discussed. TOPIC TAGS: hydrocarbon, acetylene, electropyrolysis, Diesel fuel, acetylene production, hydrocarbon pyrolysis

ABSTRACT: A laboratory apparatus for producing acetylene by electropyrolysis of liquid hydrocarbons is described (see Fig. 1 in the Enclosure) and the most successful construction of the reactor is schematically illustrated (see Fig. 2). The influence of the dimensions and weight of the movable contacts as well as of the distance between the stationary electrodes is investigated. The yield in the reactor increased and the consumption of electricity per 1 m³ gas decreased with increasing dimensions of the movable contacts. With increasing weight of the movable contacts, the electric consumption per 1 m³ acetylene increased and the gas yield increased proportionally to the load; the composition of the

Card 1/4

ACCESSION NR: AT4043276

pyrolytic gas remained constant. Decreasing the distance between the stationary electrodes from 45 to 25 mm increased the yield 3-4 times and decreased the electric consumption by 25-30%. The composition of the gas did not depend on the distance between the electrodes, but in order to ensure stable parameters for the process the distance must be kept constant. A plot of the intensity of electropyrolysis against time showed a gradual decrease in efficiency. Abrasion of the movable contact caused the consumption of electric energy to increase slightly and the gas yield to decrease. The composition of the gas obtained by pyrolysis of sulfur-containing Diesel fuel is tabulated and the effect of the raw material on the process is discussed. Calculations based on the experimental data showed that this process is very economical. The price of acetylene obtained by this method is only 66% of that obtained by the carbide method. The simplicity of the apparatus and process, the absence of high pressure and temperature and the high acetylene concentration are further advantages. Orig. art. has 4 figures and 4 tables.

7
TITLE: Experimental acetylene production by high temperature pyrolysis in a tubular furnace.

SOURCE: Neftepererabotka i neftekhimiya, no. 1, 1964, 27-31

TOPIC TAGS: pyrolytic acetylene, butane pyrolysis, propane pyrolysis, tubular furnace, acetylene production

ABSTRACT: This is a description of semi-industrial production runs carried out to investigate and improve acetylene production by pyrolysis of butane or propane at high temperatures. The work was initiated by Giprogauchuk and carried out at the Ufimskiy khimicheskiy zavod (Ufa Chemical Plant) in 1961-62. The work was handicapped by recurrent shortages of raw materials. However, it was found that production on an industrial scale in a high-temperature tubular furnace is possible. A new model tempering device of the collector type, mounted on rollers to compensate for the thermal expansion and contraction of furnace tubes, was devised of double-walled Kh18N9T steel. A panel of flameless burners in the reaction furnace was finally provided with nozzles of Kh18N12M2T steel, heat resistant to 800°C. The operation provided for dilution of raw material with steam in a proportion of

Card 1/2

L 20131-65

ACCESSION NR: AP4049724

2

1:2, a contact time of 0.12 sec, and a temperature at the furnace outlet of 1100C. The planned and actual yields in % by weight were respectively: hydrogen 5.2/3.7-3.1, methane 20.8/29.0-27.2, acetylene 20.5/12.7-14.3, ethylene 25.5/35.2-34.9. There was less CO₂, resins and coke than foreseen. Reaction gases were preheated to 700C before entering the furnace. The cost of pyrolytic acetylene is one half that of carbide acetylene. Utilization of ethylene will bring the cost down still further. Orig. art. has: 3 figures and 2 tables.

General discussion and report of experiments, with two tables, and four photographs, concludes that introduction of titanium into electrode wire does not stabilize molten metal as titanium is nearly all burnt. Metal deposited by 18-8 and 25-30 type

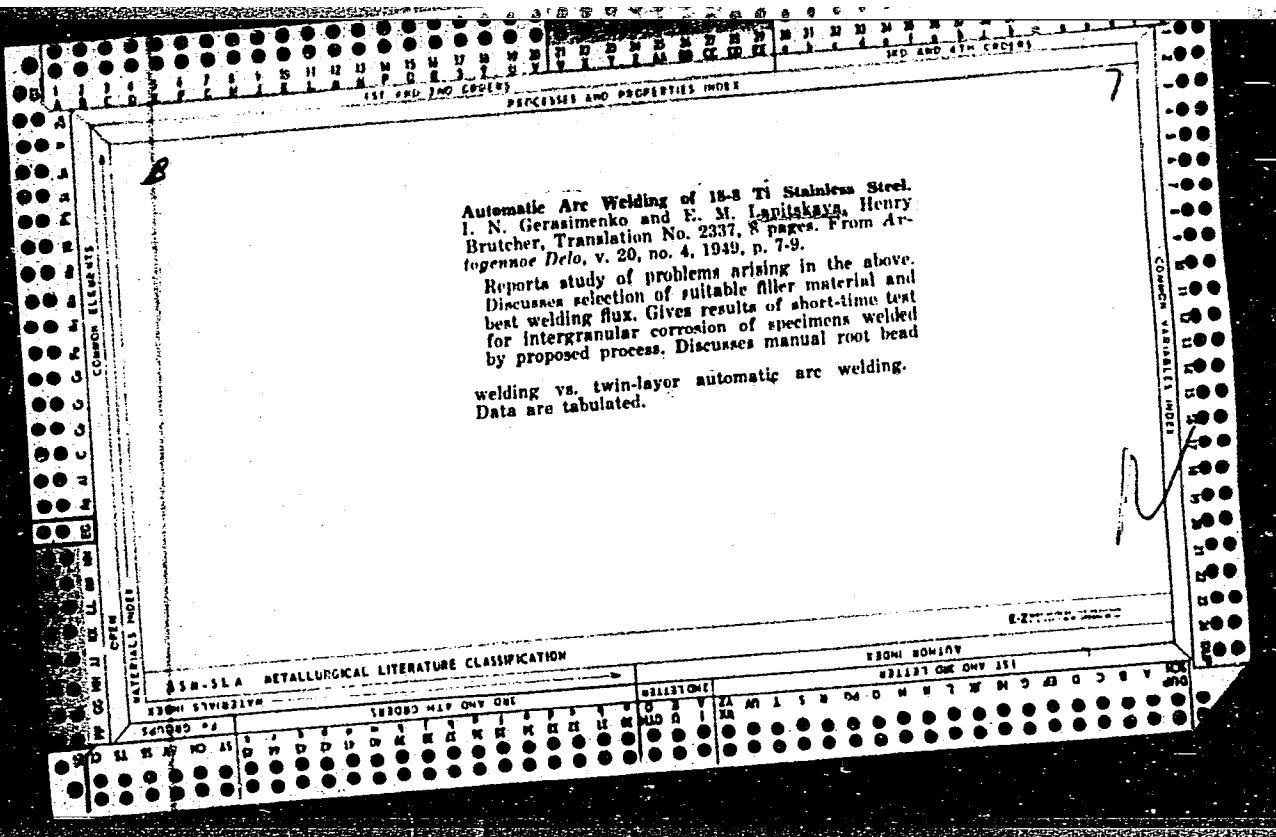

20/49742

USSR/Engineering (Contd)

Sep 48

electrodes without stabilizers is prone to inter-crystalline corrosion. Addition of molybdenum helps prevent corrosion. However, even with molybdenum added, metal undergoes intercrystalline corrosion after heating for 2 hours at 650° and subsequent slow cooling. Niobium does not have this disadvantage.

USSR/Metallurgy - Steel for Petroleum Equipment

"Investigation of the Corrosion Resistance of EZn-1 Steel and Its Welded Joints," Ye. D. Surovtseva, N. V. Sukhobokova, Ye. M. Lapitskaya, Engineers

"Avotgen Delo No 9, pp 8-12

Studies properties of low-carbon high-chromium steel used mainly as protective layer of clad metal and also for some parts of equipment in cracking plants. Tests specimens were kept in operating rectifying tower for one yr. Practically no corrosion destruction was observed: Loss in wt amounted to 0.8% and no change in thickness was revealed. Welds made with electrodes of type 18-8 with Cb proved to be most sound joints without tendency to intercyst corrosion. Suggests that optimum anticorrosive properties may be attained by using electrodes of chem compn close to that of steel to be welded.

Reaction of niobium pentoxide with sodium hydroxide. I. V. I.
Spitkin and A. V. Lapitskii (*J. Appl. Chem. Russ.*, 1942, **15**, 194--203).—Even after being heated at 1000° Nb_2O_5 reacts with $n=48\%$ NaOH on a H_2O -bath or with molten NaOH at 650°. After dissolving the reaction product in H_2O the salt $\text{Na}_2\text{Nb}_2\text{O}_9 \cdot 3\text{H}_2\text{O}$ (I) is formed. It is sol. in H_2O (1.6 g. in 100 c.c. of solution at 20°) but the solubility is much lowered by NaOH (at 0° 0.11 g. in n -NaOH, 2.6 g. in H_2O). NaNbO_4 after being heated at 1000° is not attacked by boiling 8--40% NaOH; it cannot be an intermediate product in the alkaline dissolution of Nb_2O_5 . With NaOH, $\text{NaNbO}_4 \cdot 3\text{H}_2\text{O}$ easily affords (I). (See also C., 1944, Part 2.) J. J. B.

Anhydrous lithium metaniobate. A. V. Lapitakil (M. V. Lomonosov State Univ., Moscow). *Zhur. Osnovy Khim.* (J. Gen. Chem.) 22, 38-41 (1952).— LiNbO_3 was prepared according to Joly (*Ann. sci. Ecole Norm.* 16, 125 (1877)) by fusion of Li_2CO_3 , LiF, and Nb_2O_5 , and also by heating equimol. aunts. of Li_2CO_3 and Nb_2O_5 in a Ag crucible at 700° to const. wt. In both cases, the product was yellowish and finely cryst., d. 4.283 and 4.308, resp., m.p. $1104 \pm 2^\circ$. N. Thon

CA

Anhydrous potassium metacolumbate. A. V. Lapitskii
(Moscow State Univ.), *Zhur. Obshchey Khim.* ("J. Gen.
Chem.") 22, 370-84 (1952).— $K_2Cb_6O_9$ was prep'd. by 3 meth-
ods: (1) Pure Cb_6O_9 was fused to a Pt crucible with equimol.
amts. of K_2CO_3 and KF (as flux), and the melt was extd.

with boiling H_2O . The crystals are cube-shaped, similar to
those of $NaCb_6O_9$. (2) Equimol. amts. of Cb_6O_9 and K_2CO_3 ,
well mixed, were heated in Ag crucible at 800° until cessation
of evolution of CO_2 ; the slight excess of unchanged K_2CO_3
was extd. with H_2O . The crystals were similar to
those obtained by the 1st method. (3) A mixt. of Cb_6O_9 :
 $K_2CO_3 = 1:5$ mol. was fused with the aid of a torch and extd.
with cold H_2O . The product has the compn. $K_2Cb_6O_9 \cdot 2H_2O$.
This was calcined in Pt 2 hrs. at 700° , and gave
fine short prisms of KCb_6O_9 . The pyrometric d. of the 3
prpsns. were, resp., 4.596, 4.588, 4.586, av. 4.590. The 3
prpsns. m. $1184 \pm 2^\circ$. The fusion is not accompanied
by decomprn. By x-ray examn., all 3 prpsns. have the same
cubic lattice, with $a = 4.007 \pm 0.003$ Å.; the x-ray d. is
4.014. N. Thon

Reactions of sodium carbonate with niobium pentoxide
Vilk, I., Solntsev, and A. V. Janitskii [et al.]
Soviet. Selsk. Khozyaistvo i Promst. Sistem. Sistem. Obshchestv. Khim.
Akad. Nauk S.S.R. 1, 37-42(1953); cf. C.A. 48, 3180a.
Mixts. of Na₂CO₃ and Nb₂O₅ do not react below the m.p. of
Na₂CO₃ at atm. pressure or *in vacuo*. Mixts. contg. Na:Nb
3:1 and 5:1 kept for 2 hrs. at 865° (atm. pressure) gave
white meiss which on analysis led to the following conclu-
sions: the 3:1 mixt. had a little Na₂CO₃ left, the 5:1 mixt.
more than 30%; in the former the loss of CO₂ was little
less than required for the formation of orthonobate, in the
latter a little more. It is postulated that in the 3:1 mixt.
with the orthonobate a little pyroniobate, Na₂Nb₂O₇, was
present and in the 5:1 mixt. a little Na₄NbO₆. Similar
expts. were carried out *in vacuo*. No reaction took place
below 700°; at 800° the product of a 1:1 mixt. was a 7:6
salt and that of the 4:1 mixt. heated at 600, 800, 1000, 1100,
and 1200° was the 7:6 orthoniobate. The former was

REVIEWED (07/11/81 RHM) the products of the reaction of NaNbO_4 with Na_2CO_3 and that of the Na_2CO_3 alone heated at 800, 900, 1000, 1100, and 1200° was the 7:8 orthonilobate. The former was confirmed under 700 magnification; the latter by chem. analysis; x-ray analysis ruled out the possibility of the formation of anhyd. metanilobate. That metanilobate was not an intermediate product was shown by heating NaNbO_4 with Na_2CO_3 at 875° for 1 hr. at atm. pressure in vacuo; no reaction took place.

Inorganic Chemistry

Reaction of niobium pentoxide with sodium hydroxide.
Vikt. I. Spitsyn and A. V. Lapitskiy. *Zhur. Priklad. Khim.* 26, 117-23 (1953). — Nb_2O_5 , $\text{NaNb}_3\text{O}_5 \cdot 3\text{H}_2\text{O}$, and $\text{Na}_4\text{Nb}_5\text{O}_{10} \cdot 32\text{H}_2\text{O}$ were fused with NaOH to prove an earlier postulate (*C.A.* 37, 2287) that salts will result which upon treatment with water will have a Na:Nb ratio of 7:8. As expected, fusions of 1:1 and 7:8 salts with NaOH at 850, 450, and 650°, lasting 11 hrs., resulted in a 7:8 salt (Nb_2O_5 61.21%, H_2O 22.12%, and Na_2O , by difference, 16.67%). Excess of NaOH from fusion of Nb_2O_5 -NaOH could be removed only by digestion with abs. EtOH. The grayish powder formed showed no cryst. structure under a 375 magnification. The analysis of the powder after drying to const. wt. at 120° corresponded to the salt $\text{Na}_4\text{Nb}_5\text{O}_{10}$. That 5:1 salts are possible was shown previously (*C.A.* 25, 2381; 34, 407). Crystallographic as well as thermal analyses prove it. It m. 930° d₄ 4.405. Hydrolysis gives $\text{Na}_4\text{Nb}_5\text{O}_{10} \cdot 32\text{H}_2\text{O}$ and NaOH. I. Bencowitz.

Transliterated Title: Polucheniye radioaktivnykh izotopov

PUBLISHING DATA

Originating Agency: None

Publishing House : State Scientific and Technical Publishing House of Chemical Literature

Date: 1954 No. pp.: 193

No. of copies: 10,000

Editorial Staff: None

PURPOSE AND EVALUATION: This book is designed for research workers interested in nuclear chemistry and physics and in the application of the method of tagged atoms. The material is organized clearly and concisely and is brought up to date. The text is amply illustrated with formulas, diagrams, and tables. Of great value is the extensive bibliography (2089 references). This volume may be favorably compared with books on the production of isotopes published in the U. S.

TEXT DATA

Coverage: Mendeleev's periodic system and the difficulties arising in the classification of elements with the atomic

Title : Some properties of tantalum pentoxide
Periodical : Vest. Mosk. un., Ser. fizikomat. i yest. nauk, Vol 9, No 2, 85-89,
 Mar 1954
Abstract : Studied the dehydration process of tantalum pentoxide hydrate in the
 temperature range of 25-450 degrees. Established the possibility of
 the existence of a tantalic acid with the composition $H_7 [Ta(TaO_4)_4]$.
 Also studied the possible polymorphic conversions of tantalum pentoxide
 using X-ray and thermographic techniques. Determined the parameters of
 two modifications of tantalum pentoxide indicated in the rhombic lattice.
 Expressed an assumption regarding the possibility of the existence of
 a tantalic acid having the composition $H_{13}[Ta(TaO_4)_6]$. One table.

LAPITSKII, A. V.

The investigation of dehydration processes of some niobates. A. V. Lapitskii, V. A. Fefelkin, and Viki. I. Spitsyn (M. V. Lomonosov Moscow State Univ.). *Dokl. Akad. Nauk SSSR* 105, 720 (1955). — The dehydration of Na and K hexaniobates, hydrated KNbO₃, and Be, Mg, Ca, Sr, Ba, and Pb hexaniobates was studied by heating the salts and plotting the loss of water, and by dehydration over concentrated H₂SO₄. The existing ideas regarding the structures of the niobates (*C.A.* 31, 332) do not seem to be correct. Five to six H₂O mols. are probably connected with the aquapoly niobate nuclei, and participate actively in their structure. The last 1-2 mols. of H₂O must be especially important in the formation of the niobate-water complexes.

Title : Study of Solubility of Hexaniobates of Some Bivalent Metals.

Orig Pub : Vestn. Mosk. un-ta, 1956, No 3, 81-86

Abstract : The solubility in water of hexaniobates of elements of the main subgroup of the II group of the periodic system of Mendeleev was studied at $20 \pm 0.1^\circ$ by the method of radioactive indicators, and the data of the solubility of lead hexaniobate were rendered more precise. The synthesis of hexaniobates of Be, Mg, Ca, Sr and Ba was carried out by the earlier described methodics (RZhKhim, 1955, 20972) by the interchange reaction between the solution of sodium hexaniobate obtained on the basis of the radioactive pentoxide of niobium and the solution of the nitrate of the

corresponding metal. The solubility was determined by measuring the activity of the precipitate obtained by evaporating the corresponding saturated solution and comparing its activity with a standard sample. It was established that the equilibrium concentration was attained 6 to 7 hours after stirring had been started. It is shown that the solubility of hexaniobates of bivalent metals decreases with the increase of the atomic number of the element.

✓ Solubilities of tantalates of alkaline earth metals. A. V.
Lapitski and A. P. Efimov. *Vestnik Moskov. Univ.* 11,
No. 6, Ser. Fiz.-Mat. i Mekhan. Nauk No. 4, 67-71 (1950).
cf. C.A. 49, 2239f; 44330.—Bietantalates and hexatantalates
of Ca, Sr, and Ba, contg. Ta¹⁸³, were stirred for 12
hrs. with H₂O at 26 ± 0.1°. By measurement of the radio-
activities of the solns., the following solubilities, in moles/l.,
were detd.: Ca(TaO₄)₄, 1.17 × 10⁻⁴; Sr(TaO₄)₄, 4.77 ×
10⁻⁴; Ba(TaO₄)₄, 2.89 × 10⁻⁴; Ca₂Ta₂O₉·33H₂O, 2.78 ×
10⁻⁴; Sr₂Ta₂O₉·32H₂O, 1.90 × 10⁻⁴; Ba₂Ta₂O₉·33H₂O,
8.31 × 10⁻⁵. Detd. by measuring the activity of Sr⁸⁵,
soln. of Sr(TaO₄)₄ was 2.39 × 10⁻⁴ g./100 ml., and that of
Sr₂Ta₂O₉·33H₂O, 5.00 × 10⁻⁴ g./100 ml. The undissolved
material was unaltered. The results indicate that neither
type of salt undergoes appreciable hydrolysis.

Title : Study of Solubility of Metaniobates of Some Bivalent Metals

Orig Pub : Vestn. Mosk. un-ta, 1956, No 5, 69-74

Abstract : The solubility (S) of metaniobates of Be, Mg, Ca, Sr and Ba at 20° was measured using radioactive indicators Nb⁹⁵ Sr⁸⁹ in extension of previous research (RZhKhim, 1955, 5447). S. of metaniobates decreases from Be(NbO₃)₂ to Sr(NbO₃)₂ and again increases noticeably at the transition to Ba(NbO₃)₂, which is in accordance with the increase of electrical conductivity observed previously. Also the S of Pb(NbO₃)₂ at 20° was rendered more precise and the solubility products of the metaniobates under study were computed.

APPENDIX IV

Isotope exchange between different types of salts of niobium
acid. V. A. Pchelkin, A. V. Lapitskii, and V. I. Spitsyn
(M. V. Lomonosov State Univ., Moscow). *Zhur. Neorg.*
Khim., 1, 841-87 (1956). The reaction of $K_4Nb_2O_7 \cdot 2H_2O$
and $KNbO_3 \cdot 2H_2O$ with various reagents was studied and
found to be identical. The isotopic exchange in a hetero-
genous system of the hexanobate and of the hydrated
metanobate was detd. at 20° by using Nb^{93} . It was estab-
lished that the exchange between the solid salt and its soln.
in either case occurs instantaneously for an av. of 60%.
This value of the degree of exchange does not increase with
time. The exchange between the hexanobate and the
metanobate was also found to be identical.
