TITLE: Ascertaining the structure of sintered materials of the Me-MeO system by ion bombardment. Report presented at the Fifth All-Union Conference of Electronic Microscopy in Sumy, July 1965

SOURCE: Poroshkovaya metallurgiya, no. 5, 1966, 67-73

TOPIC TAGS: metal metal oxide system, sintered aluminum powder, powder metallurgy, metal powder, electron microscopy, ion bombardment

ABSTRACT: A study of the structure of sintered aluminum powder material by ion bombardment is of practical significance for the investigation of materials obtained by means of powder metallurgy. The method is suggested for use for manufacturing samples prior to electron-microscopic investigations. Analysis of microphotographs shows that the base of SAP material is a cellular grid consisting of oxide particles bounded by aluminum pseudograins. Orig. art. has: 8 figures. ✓ Stabilization of gypsum solution with dextrans. M. I. Chudakov, K. P. Vakhrusheva, and L. V. Lebedeva (Hydrolysis Plant, Kansk). *Gidrolit. t-hestchkin: Prom.* 8, No. 4, 20-1 (1955).—Factors affecting the formation of supersatd. solns. of CaSO_4 in neutralization of H_2SO_4 hydrolyzates (I) at temp., the rate of growth of crystal nuclei, the amt. of ptd. CaSO_4 , the intensity of agitation, and the presence of colloidal org. compds. At 75-80° $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ is formed predominantly; higher temp. leads to the formation of $\text{CaSO}_4 \cdot 1/2\text{H}_2\text{O}$ which, on cooling to 28-30°, gives supersatd. soln. The beneficial effect on the prevention of CaSO_4 deposits on fermentation equipment, experienced in filtering partially neutralized solns. through sawdust, has motivated the study of the influence of cellulose sugars (II) on CaSO_4 solns. Boiling the soln. (pH 4.1-4.2), taken from a sedimentation tank, with sawdust showed that these solns. contained more sol. CaSO_4 than untreated. In another expt., sawdust was treated with 72% H_2SO_4 , the amt. of fermentable sugars detd., and the substrate added to I. The amt. of sol. CaSO_4 in I was almost twice as high as in the soln. without II. Neutralizing I with a mixt. of CaO and MgO led to a higher content of sulfate in the soln., as a result of the higher solv. of MgSO_4 . T. Jurecic

SOURCE: Byulleten' izobretens i tovarkh znakov, no. 5, 1965, 70		
TOPIC TAGS: polytetrafluoroethylene, plastic, thermosetting material		
ABSTRACT: This Author Certificate presents a method for obtaining pressed material from polytetrafluoroethylene. In order to give the material fluidity and the capacity for reworking into wares by the methods of plastic retreatment, the polytetrafluoroethylene with or without fillers is mixed with highly fluid thermosetting polymers (furan, resorcin furfural, and others) or monomers (such as furfuryl alcohol, β -monomer).

TITLE: Method of creating a source of diffusion of aluminum in silicon. Class 21,
No. 176989 [announced by the Physical Engineering Institute im. A.F. Ioffe, AN SSSR
(Fiziko-tehnichesky institut AN SSSR)

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 24, 1965, 45

TOPIC TAGS: aluminum, diffusion, aluminum diffusion, junction, pnp junction, npn pn
junction, pnn junction, junction forming

ABSTRACT: This Author Certificate introduces a method of forming an aluminum source
for the diffusion of aluminum in silicon in an oxidizing atmosphere such as air. To
simplify the technique and accelerate the diffusion, aluminum in the form of $\text{Al}(\text{NO}_3)_3$
solution or of a mixture of aluminum-oxide powder with powder oxides of metals such
as tungsten, titanium, or tantalum is deposited by any well-known method on the sur-
faces of silicon plates. In a variant of the above method, in order to obtain struc-
tures of the types p-n-p or n-p-n-p-n, the surface of silicon plate is first coated with
a boron or phosphorus compound and subjected to heat treatment. In a further variant
of the first and second methods, in order to form semiconducting structures of such

TITLE: Effect of ionizing radiation on vitamin C metabolism

SOURCE: Voprosy pitaniya, v. 24, no. 3, 1965, 17-22

TOPIC TAGS: ionizing radiation, ascorbic acid

ABSTRACT: White rats and guinea pigs were exposed to relatively small doses of ionizing radiation to determine its effect on vitamin C metabolism and to ascertain whether such change, if any, could be corrected by dietary means. A single exposure of rats, which synthesize ascorbic acid, to 100 r of gamma rays and prolonged (427 days) external irradiation with Co 60 (0.05 r/24 hours) markedly increased the amount of vitamin excreted in the urine, slightly reduced its content in the blood, and slightly increased it in the adrenals. In contrast, in guinea pigs, which do not synthesize ascorbic acid, the same doses significantly decreased the amount of the vitamin excreted in the urine. The addition of 150 µg of folic

AUTHORS: Strongin, M. A., Lebedeva, M. A.

TITLE: Results of the activity in the tire industry

PERIODICAL: Kauchuk i rezina, no. 1, 1963, 38 - 41

TEXT: The Soviet Seven-Year Plan for 1959 - 65 calls for a stepped-up program of the tire industry: creating a stable raw material base, developing the pace of tire production, improving the quality of the finished product. Special emphasis is placed on the production of tires for agricultural machines, automobiles, motorcycles and motor-rollers. All the tire plants, excepting the new ones at Krasnoyarsk, Baku and Dnepropetrovsk, surpassed the production plan for the first three years. Over 100 million rubles were spent in the construction and renovation of tire plants within the 1959 - 61 period. More plants are foreseen for the near future. Natural rubber (NR) is primarily used as the raw material, since 72% of all the raw material, going for truck, bus and tractor tires, is NR. The tire industry uses oil-filled butadiene-styrene rubber of regulated polymerization on a colophony emulsifier to a greater extent, thus reducing the use of

Card 1/2

Results of the activity in the tire industry

S/138/63/000/001/004/008
A051/A126

sodium-butadiene rubber. Stereo-regulated СКИ (SKI) and СКД (SKD) rubbers will appear on the market by 1965 and sodium-butadiene rubber will be discontinued. ХАФ (KhAF) finely-dispersed carbon black from liquid raw material has gained popularity as a base. New tires have been introduced, such as the MAZ (MAZ), KPAЗ 320 - 508 model ИЯВ-12 (KRAZ 320 - 508 model IYAV-12), for the ЗИЛ-164-260-20 model И-202 (ZIL-164-260-20 model I-202); ГАЗ -51-200-20 model И-238 А (GAZ-51-200-20 model I-238A); "Volga", "Moskvich" automobiles. The new tire models have a service life longer by 40 - 50% as compared to 1958 models. The use of metal cord in the tread and breaker has been introduced for truck tires. The Yaroslavl' Tire Plant produces tires for 2.5 ton vehicles, with a radial distribution of the cord threads and with removable tread rings (PC - (RS) type). Over 40 thousand of these tires have been manufactured. Type Р (R) tires for trucks and the use of metal cord are also planned. Equipment has been improved. Costs have been reduced. The mass production of the RS and R tires is considered the predominant task of the immediate future. There are 4 tables.

TITLE:	The technology of soft nitriding and its effect on the fatigue strength of steel		1
SOURCE:	Soveshchaniye po uprochneniyu detaley mashin, 1962. Protsessy uprochneniya detaley mashin (Processes of the hardening of machine parts); doklady soveshchaniya. Moscow, Izd-vo Nauka, 1964, 52-55		
TOPIC TAGS:	steel nitriding, steel cyaniding, steel fatigue strength, soft nitriding, steel wear resistance		
ABSTRACT:	The principal advantages of nitriding in comparison with carburizing and cyaniding are minimum deformation and warping of the parts. However, the duration of this process, brittleness of the nitrided layer and insufficient service life of nitrided parts limit its application. During the last few years, publications have appeared on soft nitriding which report improvement in the fatigue strength of steel parts. This method involves the use of melted cyanide salts at 520-580°C. Using this technique, tests were made to determine the absorption parameters and the properties of the diffusion layer after soft nitriding. A VTS-22

electric furnace with automatic temperature regulation was used. The furnace bath contained 50% NaCN, 18% NaCl and 32% Na₂CO₃, and the bath temperature was 550±10C. A previous publication by A. N. Minkevich noted that the source of chemically active carbon and nitrogen is the dissociation of NaCNO. Therefore, the content of NaCNO and CN in the bath was checked. Low temperature cyaniding was then used to increase the fatigue strength of cylinder liners for air cooled engines made of 38KhMYuA steel. The non-nitrided surface of this steel shows unfavorable tensile stresses. All samples for the fatigue tests were taken from one nitrided liner. Three sets of samples were made: 1) steel cyanided at 550±10C for 1.5 hours with a NaCNO content of 5.8%, 2) non-cyanided samples and 3) non-cyanided samples tempered in an alkaline bath at 550±10C for 1.5 hours. The authors conclude on the basis of the results of fatigue tests (5×10^6 cycles) that low-temperature cyaniding (soft nitriding) increases the fatigue strength of steel. Thus, low-temperature cyaniding of notched samples of 38KhMYuA steel increased the fatigue strength by 46%. The minimum deformation of parts, lower brittleness, higher fatigue strength and short duration of the process are valid reasons for using low-temperature cyaniding instead of other methods. Do to the low

The amylolysis and phosphorolysis of muscle glycogen.
A. N. Petrova and M. B. Lebedeva (Acad. Sci., Moscow).
Biokhimiya 15, 277-82(1950); cf. *C.A.* 42, 7807a; 43,
7086i.—The decompn. of carbohydrates in muscle proceeds
not only by way of phosphorolysis, but also by hydrolysis.
Both amylase and phosphorylase are found in muscle-
prepd. in the cold, or by autolysis for 1-2 days at room
temp. As is known, glycogen phosphorolysis proceeds
in the presence of phosphates and of adenylic acid; amyo-
lysis, in the presence of chlorides. Phosphorolysis *in*
vitro is unaffected by the presence of chlorides, and amyl-
ysis by the presence of phosphates and adenylic acid.
Glycogen is decompd. *in vitro* much more rapidly by the
combined action of phosphorylase and amylase than by
the sep. action of these enzymes. H. Priestley

Biological Chemistry

Separation of enzymes by paper column chromatography.
M. G. Kritsman and M. B. Lebedeva (Inst. Biol. and Med. Chem., Acad. Med. Sci. U.S.S.R., Moscow, Ukraine. Biokhim. Zhur. 22, 430-4 (1950) (in Russian).—As test materials, enzyme preps. of differing stages of purification, and concd. brain exts. from tissues, were used. Sepns. occurred by varying $(\text{NH}_4)_2\text{SO}_4$ concn. and pH, and using from 600 to 900 filter papers, 9 cm. diam. At the 40th paper on the column there were placed 10-20 papers satd. with a soln. of enzyme. The entire column was clamped between two plates of non-corrodable material. A siphon tube was placed between a vessel contg. 15-20% $(\text{NH}_4)_2\text{SO}_4$, at pH 7, and the column top. Soln. level corresponded to top of column. Through perforations the distributing tank on the column top the liquid was infused into the filter papers. A concn. gradient was produced by the addn. of H_2O , or low-concn. $(\text{NH}_4)_2\text{SO}_4$, from a dropping funnel, to the $(\text{NH}_4)_2\text{SO}_4$ soln.; the speed of entering liquid corresponded to the speed of exit liquid. A stirrer was arranged for uniform mixing, temp. 10°; 18° gave distortions. After flow was stopped every 20th filter paper was analyzed for enzymic activity, $(\text{NH}_4)_2\text{SO}_4$ concn., and protein. In an aminopeptidase expt. its activity was detd. by the colorimetric method of Leonard and Straub (*Studies Inst. Med. Chem., Univ. Szeged* 11, 59(1941)). Activities of the enzymes were detd. from the filters, without preliminary extn., by immersion into substrate. The amt. of protein was detd. by the biuret reaction, and $(\text{NH}_4)_2\text{SO}_4$ by Nesslerization. Aminopeptidase from heart muscle was prep'd. by fractional salting out with $(\text{NH}_4)_2\text{SO}_4$, the protein fraction salted out by 15-10% $(\text{NH}_4)_2\text{SO}_4$ being used. Max. cholinesterase activity was found in the 180-280 filter paper zone. The concn. of $(\text{NH}_4)_2\text{SO}_4$ in this zone corresponded to 6-15.8% $(\text{NH}_4)_2\text{SO}_4$.

Title : The Influence of Desoxycorticosterone and Cortisone
on the Protein Metabolism.

Orig Pub : Vopr. med khimii, 1956, 2, No 4, 278-286

Abstract : Hungry male rats weighing 150-300g were injected within 2-7 days 1-5mg cortisone (I) or DCC (II) intramuscularly. Control animals received 0.9% NaCl solution, or apricot oil (solvent II) in the same quantities as the solutions of hormones. In injecting I, the N of urine increased considerably, with II it was lower than in the control animals, but higher than in the starving rats, which did not receive injections. Rats injected with II lost more weight than control animals and less than the ones injected with I. After I injection the weight of liver and kidneys and their protein content increased, while the

TITLE: Electron transfer in nitroso-compound reactions. I. Mechanism of trifluoronitrosomethane disproportionation

SOURCE: Zhurnal obshchey khimii, v. 35, no. 8, 1965, 1418-1422

TOPIC TAGS: electron transition, reaction mechanism, EPR spectrum, organic nitroso compound, aliphatic fluoronitro compound, methane

ABSTRACT: The mechanism of trifluoronitrosomethane disproportionation was studied in various organic and aqueous alkaline solvents in the temperature range from -120° to 20°C. A detailed examination of the EPR spectra indicated that in the absence of a reducing agent, the first stage of trifluoronitrosomethane disproportionation in an aqueous alkaline solution $[CF_3NO + (C_2H_5O) + 20\% \text{ aqueous NaOH}]$ is as follows

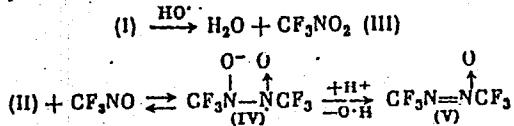

Card 1/3

L 00892-66

ACCESSION NR: AP5020084

In the next stage,

hexafluoroazoxymethane and trifluoronitromethane are formed in a reaction proceeding via the ion-radical mechanism. In the range from -120° to room temperature, the EPR spectra indicate formation of a paramagnetic species at the interphase. Examination of the structure of the EPR spectra at -120°C indicates formation of several types of free radicals. The hydroxy radicals, doublet with identical intensity and a splitting of $\Delta H = 58$ Oe, recombine at -100°C . At 20°C the ratio of intensities of the 6 hyperfine lines is close to 1:4:7:7:4:1 which corresponds to a radical incorporating a group CF_3N . Similarly, 6 hyperfine EPR lines but with-

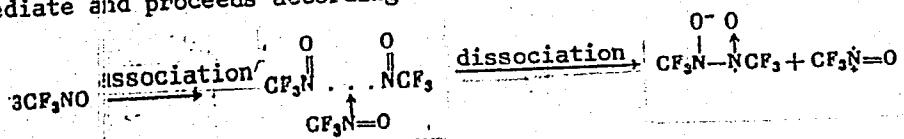

+
0
out doublet splitting were found using ethyl ether, chloroform, methyl chloride, and ethyl chloride as solvents. In the $CF_3NO + C_2H_5OH$ system the doublet splitting

Card 2/3

L 00892-66

ACCESSION NR: AP5020084

(ΔH) is equal to 3.3 Oe which is about 1.5 times greater than that found in the systems involving either toluene or hexane. No EPR spectrum corresponding to trifluoronitrosomethane was found using either carbon tetrachloride or trifluoroacetic acid as solvents. The transformation of trifluoronitrosomethane into the dimetric ion-radical (IV) in the absence of a reducing agent involves formation of a π -complex intermediate and proceeds according to the following mechanism

B

ORG: none

TITLE: Electron transfer in reactions of nitroso compounds

SOURCE: AN SSSR. Doklady, v. 167, no. 5, 1966, 1083-1086

TOPIC TAGS: organic nitroso compound, free radical, EPR spectrum, electron donor

ABSTRACT: In a continuation of the study of electron transfer processes in donor-acceptor transformations of nitroso compounds, the following systems consisting of trifluoronitro-somethane and typical nucleophilic compounds were analyzed: (A) $\text{CF}_3\text{NO} + \text{amines}$ ^{1/2} ((C_2H_5)₃N; $\text{C}_5\text{H}_5\text{N}$; $\text{C}_6\text{H}_5\text{NH}_2$; $\text{C}_6\text{H}_5\text{NHCH}_3$; $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2$); (B) $\text{CF}_3\text{NO} + \text{C}_6\text{H}_5\text{SH}$; (C) $\text{CF}_3\text{NO} + (\text{iso-C}_4\text{H}_9\text{O})_3\text{P}$; (D) $\text{CF}_3\text{NO} + \text{RNNO}$; R = ((CH_3)₂, (C_2H_5)₂); (E) $\text{CF}_3\text{NO} + (\text{CH}_3)_2\text{CC}_1\text{NO}$, and also (F) $\text{CF}_3\text{NO} + \text{C}_2\text{H}_5\text{ONO}$; (G) $\text{CF}_3\text{NO} + \text{aldehydes}$ (CH_3CHO , $\text{C}_3\text{H}_7\text{CHO}$, $\text{C}_6\text{H}_5\text{CHO}$). In these systems, in the temperature range from -160 to +20°C, EPR spectra were obtained, indicating a radical nature of the transformations taking place. The signals are attributed to ion radicals of the type $\text{CF}_3\text{N}^{\bullet}\text{-D}^{\bullet}$ (where D is the donor molecule) and $\text{CF}_3\text{NO}^{\bullet-}$, and also to products of secondary reactions. The formation of these ion radicals in systems A-F indicates that oxidation-reduction processes occur during the initial stages of the reaction between the nitroso compound and the nucleophilic molecule, the latter acting as the electron donor. TITLE: The White Stork in the Azerbaydzhhan SSR (Belyy aist v Azerbaijan SSR)

PERIODICAL: Priroda, 1958, Nr 9, pp 104-105 (USSR)

ABSTRACT: The Komissiya po okhrane prirody AN SSSR (Commission for the Protection of Nature AS USSR), Moskva, V-71, Leninskiy prospect, 33, is engaged in counting the number of nesting white storks in the USSR, at the request of the International Committee for the Protection of Birds. The white stork (*Ciconia ciconia L.*) is found frequently in Azerbaydzhhan. The author participated in the banding of this species in Azerbaijan in June 1957. It was found that there are no white stork nests in the Astara and Lenkoran' districts at the present. The inhabitants explain that the birds are afraid of the bright projector lights that protect these border districts

Card 1/2

The White Stork in the Azerbaydzhan SSR

TOPIC TAGS: petroleum, sulfur, organic compound, distillation, extracting agent, dearomatization, desulfurization

ABSTRACT: The authors point out the need of knowing the distribution of phases among petroleum products in order to solve problems concerning extraction and extractive distillation of organo-sulfur products. Investigations were made on organo-sulfur compounds dissolved in distillate fractions of high-sulfur Kezan'kova petroleum subjected to preliminary dearomatization and desulfurization. The characteristics of the extracting agents were tabulated. The organo-sulfur compounds were dissolved in the distillate, held at 20°C for 20-30 minutes, shaken for 10 minutes, and then let stand at the same temperature till the material

settled into distinct layers (1-6 hours). The phases were then separated, weighed, and analyzed. The concentration of organo-sulfur compounds was determined in both extracted and refined phases. The experiments show that sulfo-organic compounds may be 90% extracted from petroleum fractions and may be concentrated by a factor of 10-17 with a single run of raw material in the solvent. Best extraction was obtained for the systems: acetic anhydride--122-150° fraction--2-ethyl thiophane, and furfuryl alcohol--95-122° fraction--thiophane. Orig. art. has: 3 figures and 5 tables.

AUTHOR LEBEDEVA, M.N.
TITLE Quantitative Distribution and Biomass of Microorganisms within the
 Oxygen Zone of the Black Sea
 (Kolichestvennoye raspredeleniye i biomassa mikroorganizmov v kislo-
 rodnoy zone Chernogoc morya. Russian)
PERIODICAL Doklady Akademii Nauk SSSR, 1957, Vol 115, Nr 1, pp 186-198 (U.S.S.R.)
ABSTRACT The method of direct microscoping on membrane-ultra-filters, widely
 used during recent years, made it possible to obtain an idea of the
 density of the population of microorganisms in water. The North-Western
 part of the Black Sea, however, has not yet been studied. The
 material was collected by means of Nansen's bathometer in 1951 (146
 samples from a depth of from 0 - 98 m were taken). The number of
 microorganisms differs in this area between 14.000 and 495.000 per
 m. Their number is greatest in depths of from 0 - 25 m. Also the
 average values of biomass for the strata of from 0 - 25, 0 - 50,
 0 - 100 and 0 - 200 m prove the compact character of the main mass
 of microorganisms with the upper strata of from 25 - 50 m as well
 as the decrease of micro-population with growing depth. The biomass
 of the phytoplankton in the strata of from 0 - 50 and 0 - 200 of the
 whole Black Sea amounts to 3,6 - 4,8 million tons respectively, the
 biomass of microorganisms to 0,7 - 1,3 million tons for the same

strata. Table 1. shows the biomass per 1 m³ in the stratum of from 0 - 10 m. Starting the average biomass of the sulphurated hydrogen zone and from the volume of the depth of sulphurated hydrogen we can assume a total amount of 17,2 million tons of microorganisms for this area. This means that microorganisms form about 20 - 25 % of the total living substance. The biomass of the microorganisms in the oxygen zone amounts to about one fourth of the biomass of the phytoplankton. Comparison of the number as well as of the biomass of the microorganisms in various seas shows that the Black Sea does not range behind the central and Southern Caspian Sea as regards the density of micro-population and that it is greater than that of a number of other water. (2 illustrations, 2 tables and 19 Slavic references).
