TITLE: On the Spaces of a Symmetric, Almost Symplectic Connectivity  
(O prostranstvakh simmetrichnoy pochti simplekticheskoy svyaznosti)PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol. 115, Nr 4, pp. 655-658  
(USSR)ABSTRACT: The present paper examines the spaces of the symmetric, affine connectivity  $\Gamma_{jk}^l$  which is associated with the non-degenerate skew-symmetric tensor  $a_{ij}$ . The fundamental defining property of these spaces is the requirement of the proportionality of the covariant differential of the fundamental tensor  $a_{ij}$  and its external differential:

$$\frac{\partial a_{ij}}{\partial x^k} - a_{ij} \Gamma_{jk}^l - a_{lj} \Gamma_{ik}^l = \mu(x) \left( \frac{\partial a_{ij}}{\partial x^k} + \frac{\partial a_{ja}}{\partial x^i} + \frac{\partial a_{ki}}{\partial x^j} \right).$$

By a cyclical distribution of this relation with regard to  $i, j, k$   $\mu(x) = 1/3$  is obtained. By transformationCard 1/3  $\Gamma_{jk}^l = (1/3)a^{li} \left( \frac{\partial a_{ij}}{\partial x^k} - \frac{\partial a_{ki}}{\partial x^j} + \gamma_{ijk}(x) \right)$  is obtained.

20-4-6/60

On the Spaces of a Symmetric, Almost Symplectic Connectivity

In this connection  $a^{li}a_{ik} = \delta^l_k$  is valid and the  $\gamma_{ijk}(x)$  are symmetric with regard to all index-pairs. The  $\gamma_{ijk}$  defining a field of geometrical objects invariantly associated with the tensor  $a_{ij}$ . The  $\gamma_{ijk}$  are a symmetric, affinitive connectivity and the  $\gamma_{ijk}$  occurring in it define the "rig" of the manifold on which the tensor  $a_{ij}$  is assumed. A differentiable manifold with  $2n$  dimensions with a non-degenerate skew-symmetric tensor  $a_{ij}$  assumed on it and with the object  $\gamma_{ijk}$  defining the "rig" is here designated as "space of the symmetric, almost symplectic connectivity". Thereafter the tensor of curvature  $R_{ijk}^{\alpha\beta} = \frac{\partial \Gamma_{jk}^\alpha}{\partial x^i} - \frac{\partial \Gamma_{ik}^\alpha}{\partial x^j} + \Gamma_{ik}^\beta \Gamma_{jb}^\alpha -$

-  $\Gamma_{jk}^\beta \Gamma_{ib}^\alpha$  is investigated. In the case  $B_{ij,kl} = 0$  one can go over to the Cartesian system of coordinates. The spaces corresponding to the case  $B_{ij,kl} = 0$  can be called plane spaces with symmetric, almost symplectic connectivity. Every point of the plane manifold can be associated with a plane space of the type shown here. Finally the covariant vector  $b_i =$   
 Card 2/3  $= (1/2)a^{pq}\Gamma_{pqi}^{\alpha\beta}$  is investigated.

AUTHOR: LEMLEYN, V.G. (Moscow) 20-5-7/54

TITLE: The Tensor of Curvature and Some Types of Spaces With Symmetric Almost Symplectic Connection (Tenzor krivizny i nekotoryye tipy prostranstv simmetrichnoy pochti simplekticheskoy svyaznosti) SSSR

PERIODICAL: Doklady Akademii Nauk, 1957, Vol. 117, Nr 5, pp. 755-758 (USSR)

ABSTRACT: The author continues the investigation of the spaces of symmetric almost symplectic connection previously considered by himself [Ref.1]. For their tensor of curvature  $B_{ij,kl} = a_{1d} R_{ij,kl}$  he gives the properties

(1)  $B_{ij,kl} + B_{ji,kl} = 0$

(2)  $B_{ij,kl} + B_{jk,il} + B_{ki,jl} = 0$

(3)  $B_{lj,ik} + B_{jl,ki} + B_{ki,jl} + B_{ik,lj} = 0$  etc.

Then such spaces of symmetric almost symplectic connection are considered for which the elements of the Lie algebra of the holonomy group, which are associated to the elementary cycles, belong to the Lie algebra of the symplectic group.

Card 1/3

The Tensor of Curvature and Some Types of Spaces With Symmetric Almost Symplectic Connection 20-5-7/54

For these spaces the relation

(4)  $\nabla_i \nabla_j a_{ki} = 0$  is characteristic. This relation is satisfied by the spaces with

$$T_{ijk} = \frac{1}{3} \left( \frac{\partial a_{ij}}{\partial x^k} + \frac{\partial a_{jk}}{\partial x^i} + \frac{\partial a_{ki}}{\partial x^j} \right) = 0$$

and by the spaces with  $B_{ij,kl} = 0$ . An example of a further space (different from the two latter special types) for which (4) is satisfied is given. Finally spaces od symmetric almost symplectic connection are considered for which

$$(5) b_i = \frac{1}{2} a^{jk} T_{jki} = 0 .$$

These are spaces with covariantly constant volume

$$\sqrt{\det \|a_{ij}\|} \det \|x_{(1)}^k\|.$$

From (5) it follows that the space is equiaffine but not conversely. If the dimension of the space is 2 or 4, then it follows from (5) that the space is symmetrically symplectically

TITLE: Generalization of Invariant Differentiation in a Fractional Linear Group and Splitting of an Affine Connectivity Object

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 4, pp 672-673 (USSR)

ABSTRACT: According to the usual rules the invariant differentiation in the group of broken linear transformations can be carried out for the construction of a covariant differential if instead of the affine connectivity object  $\Gamma_{jk}^p$  a certain object

$$(3) \quad \gamma_{jk}^p = \frac{1}{(n+1)} \delta_j^p \frac{\partial \ln a}{\partial x^k} + \frac{1}{(n+1)} \delta_k^p \frac{\partial \ln a}{\partial x^j}$$

is used, where  $a$  is a relative scalar with the weight 1.The affine connectivity object  $\Gamma_{jk}^p$  can be split into two objects: 1) in  $\gamma_{jk}^p$  which introduces the invariant differentiation in the fractional linear group and which is determined only by  $a$ , and 2) in the so-called symmetrical combining object

Card 1/2

Generalization of Invariant Differentiation in a Fractional Linear Group and Splitting of an Affine Connectivity Object

SOV/20-128-4-9/65

$G_{jk}^p = G_{kj}^p$  which with respect to the invariant differentiation in the fractional linear group plays the same part as  $\Gamma_{jk}^p$  with respect to the ordinary differentiation.

S/020/60/132/06/10/068  
C111/C222TITLE: Projective and Projective - Metric Transfers in Manifolds With Affine  
Connectivity and in Riemannian Spaces

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 132, No. 6, pp. 1261-1264

TEXT: On the differentiable manifold  $\{V^n\}$  let be given the object  $(a_i)$   
the components of which are transformed by the coordinate transformation  
 $x^{i'} = x^{i'}(x^i)$  as follows :

$$a_{i'} = \frac{\partial x^i}{\partial x^{i'}} a_i - \frac{1}{(n+1)} \frac{\partial \ln \det ||\partial x^r / \partial x^{r'}||}{\partial x^{i'}}$$

Let to every vector  $(\xi^i)$  of the central affine tangenting space  $\{A^n\}$   
correspond the object

(1)  $u^i = \frac{\xi^i}{-a_1 \xi^1 + 1}$

Card 1/4

81391

Projective and Projective-Metric Transfers  
in Manifolds With Affine Connectivity and  
in Riemannian Spaces

S/020/60/132/06/10/068  
C111/C222

of the locally central - projective space  $\{P^n\}$  (compare (Ref. 1)) ; let to every covector  $(\xi_i)$  of the space  $\{B^n\}$  dual to  $\{\Lambda^n\}$  correspond the object

$$(2) \quad u_i = \xi_i + a_i$$

of the space  $\{Q^n\}$  dual to  $\{P^n\}$ . The defined correspondences are biunique since the formulas (1), (2) do not depend on the choice of the coordinates in the  $\{V^n\}$  and can be written in the form

$$(3) \quad \xi^i = \frac{u^i}{a_1 u^1 + 1},$$

$$(4) \quad \xi_i = u_i - a_i.$$

The object  $(u_0^i)$  defines an invariant point in  $\{P^n\}$  and in  $\{Q^n\}$  it de-

Card 2/4

81391

Projective and Projective-Metric Transfers  
in Manifolds With Affine Connectivity and  
in Riemannian Spaces

S/020/60/132/06/10/068  
C111/C222

fines the invariant plane  $u_i^0 u_i + 1 = 0$  while  $(u_i^0)$  in  $\{P^n\}$  defines an invariant plane and in  $\{Q^n\}$  it defines an invariant point.

If on  $\{V^n\}$  an affine connection  $(\Gamma_{jk}^p = \Gamma_{kj}^p)$  is given, then

$\frac{\partial \xi^i}{\partial x^k} + \xi^l \Gamma_{lk}^i = 0$  describes a parallel transfer of the vector  $(\xi^i)$ .

Substituting for this vector its value (3), then one obtains

$$(10) \quad \frac{\partial u^q}{\partial x^k} = - u^j \Gamma_{jk}^q + u^j u^q \left( \frac{\partial a_j}{\partial x^k} - a_i \Gamma_{jk}^i \right).$$

This system determines the projective transfers of the local central-projective spaces  $\{P^n\}$  along a curve on  $\{V^n\}$ .

Then the author considers the case of a Riemannian connectivity  $\Gamma_{jk}^p$  and

On the Geometric Meaning of the Projective Curvature Tensor in Manifolds  
With Affine Connectivity

the curvature tensor of the local space which is calculated in the  
corresponding point.

The author investigates several spacial cases. In the case of  
equiaffine projective-Euclidean spaces under nondegenerate Ricci  
tensor of the original affine connection the author introduces a  
scalar magnitude  $K(x)$  so that the local spaces are transformed into  
spaces of constant curvature  $K(x)$  with a special metric tensor.

The author refers to the possibility of expressing the tensors  
 $P_{k,ji}^h(x)$  and  $Q_{k,ji}^h(x)$  by the components of the connecting object  
(see (Ref.7)) and their first derivatives.

ABSTRACT: The authors combine arguments from the technical literature of many countries to support their conclusion that radioactivity is a principal source of terrestrial heat. The argument is based on these points: heat from the sun is not felt at depths beyond 20 meters; heat from the interior of the earth (if its origin was as a part detached from the sun) should have been exhausted after about 40 million years, while current estimates of the earth's age are much higher than this; and there exist huge quantities of widely distributed radioactive substances in the interior of the earth. Title : Pertaining to Methods of Measuring ECG Waves

Orig Pub : Tr. 1-y Rizhsk. gor. klinich. bol'nitsy. Riga, 1957,  
51-58

Abstract : When measuring the height of the waves from the so-called isoelectric line, the thickness of this line, which varies from 0.5 - 3 mm, is not taken into consideration. Depending on whether the waves are measured from the upper or lower border or from the middle of the isoelectric line, a considerable difference in the size of the waves and of the angle "alpha" may be noted. It is recommended that the positive waves of the ECG be measured from the upper border and the negative waves

Card 1/2

of the Electrocardiogram

Orig Pub : Tr. 1-y Rizhsk. gor. klinich. bol'nitsy. Riga, 1957,  
59-62

Abstract : The size of the angle "Alpha" can be conveniently  
determined from tables on which its values are shown  
correlated to the values of the ECG waves in the leads  
I and III. The accuracy of the findings, however, de-  
creases as the absolute sizes of the ECG waves diminish.  
A diagram of a perfected device is given, by which the  
angle "Alpha" can be determined in the process of a  
synchronous determination of the values of the ECG

HUNG

- 33. New compounds with local anaesthetic activity —  
D. Beke, K. Lempert and L. Gyermek. (*Magyar Kémiai Folyóirat* — Vol. 58, 1952, No. 10, pp. 310—312, Vol. 60, 1954, No. 5, pp. 117—151, 5 tabs.)

It is known mainly from the investigations carried out by Löfgren and collaborators that the aminosalicylic anilides, toluidides, etc. (the xylocaine group) possess valuable local anaesthetic properties. In order to establish the relations between the chemical structure and the local anaesthetic activity nuclear substituted halogen derivatives of these compounds were prepared. The diethylglycyl halogen anilides and toluidides prepared from the corresponding chloroacetyl derivatives show local anaesthetic activity and several compounds even surpass Novocaine in this respect; their toxicity is low but strong local irritating properties prohibit their practical use. These irritating properties may be diminished and simultaneously the biological activity of the compound increased by the introduction of a second free aromatic amino group. However, the thus obtained derivatives are highly toxic. This toxicity can be diminished by the acylation (acetylation or succinylation) of the

2

X-2

JUL 21

*D. Bebas etc.*

second amino group but their activity is reduced thereby. The N-(diethylglycyl)-2,6-dichloro-4-succinylamino-anilide prepared has a "zwitter" ionic structure and therefore it is water soluble. It proved to be a more potent local anaesthetic than Novocaine in spite of its free (more precisely, ionized) carboxyl group. Several quaternary derivatives of the compounds mentioned above were prepared and investigated in respect to their pharmacological value. The local anaesthetic activity of the alkyl quaternary compounds is low, the activity of the allylic quaternary compounds was found to be of the same order as that of the tertiary salts. Due to their low solubility in water the biological activity of the benzylic quaternary compounds was not investigated. In respect to the effect of the nuclear substituents on the local anaesthetic potency of these compounds the conclusion can be drawn that not only the steric factors — assumed by Löfgren and collaborators to be solely responsible for the pharmacologic activity — but the electron affinity of the substituents is also of decisive importance.

Title: New Local Anesthetic Agents

Original  
Periodical: Neue Lokalanaesthetisch wirksame Verbindungen, Acta chim. Acad. sci., hung., 1954, 5, No 1-2, 143-149; German; Russian and English resumés

Abstract: There have been prepared a number of N-diethylglycyylanilides  $\text{ArNHCOCH}_2\text{N}(\text{C}_2\text{H}_5)_2$  (GA) containing various halogen and alkyl substituents in the aromatic nucleus and the local anesthetic properties of the hydrochlorides and acid succinates (AS) of these compounds have been investigated. On treatment of  $\text{ArNH}_2\text{ClCH}_2\text{COCl}$  there are obtained  $\text{ArNHCOCH}_2\text{Cl}$  (CA) with a yield of 70-90% which give with  $\text{HN}(\text{C}_2\text{H}_5)_2$  the GA with a yield of 60-70%. The following CA and GA have been prepared (listed are: Ar, MP ° C, of CA, and

✓ New local anesthetics. II. D. Beke, K. Lempert, and L. Gyermek  
*(Acta Chim. Hung.* 1954, 5, 151-158; cf. preceding abstract).—  
Pharmacological examination of the substituted diethylglycylanilides shows that, within this class of compounds, the introduction into the mol. of a further substituent (halogen, alkyl, NO<sub>2</sub>, NH<sub>2</sub>, or acylamide group) into the free *ortho* position (with respect to the diethylglycylanilide group) increases the anesthetic activity irrespective of the electron affinity of the new substituent. Steric factors therefore appear important. If the same substituents are introduced into the free *para* position of the 2 : 6-dihalogenodiethylglycylanilide, their effect on the biological activity of the product depends on their electron affinity. The prep. is described of a series of 2 : 6-dichloro- or -dibromo-4-acetamidoanilides with an *N*<sup>1</sup>-diethylglycyl group. The dihalogeno-4-nitroaniline is treated with CH<sub>2</sub>Cl-COCl, and the product treated with NHET<sub>2</sub> to give the dihalogeno-4-amino-*N*-diethylglycylanilide which is reduced and acylated to the dihalogeno-4-acetamido-*N*-diethylglycylanilide. Quaternary deriv. of the last-named are prepared. Formulae and m.p. of all compounds are given.  
H. Wren.

32. New compounds with local anaesthetic activity, IV.  
K. Lempert, I. Gyermek. *Magyar Kémiai Folyóirat*, Vol. 61, 1955, No. 7, pp. 193-195

Analogues of 2-dimethyl-aminoethylindole — a compound of local anaesthetic activity — were prepared by introducing other heterocyclic systems into the molecule. (1) By reacting *o*-phenylenediamine with monochloroacetic acid and diethylamine 2-diethyl-amino-methylbenzimidazole was obtained which was converted to its crystalline dichlorohydrate (m. p. 209 to 211 °C) by the ethylacetate-hydrochloric acid-ether method. (2) The condensation of *N,N'*-diethyl-glycnonitrile with *o*-aminothiophenol yields directly 2-diethylamino-methylbenzothiazole. This compound was obtained in better yields by the interaction of *o,o'*-diamino-diphenyl disulphide with chloroacetyl chloride and diethylamine through the intermediates 2,2'-di-(chloroacetamino)-diphenyl disulphide and 2,2'-di-(diethylglycylamino)-diphenyl disulphide by reductive cyclization. The monochlorohydrate of this compound yields hygroscopic white needles melting at 132—133 °C. (3) The bromination of quinaldine with bromosuccinimide yields 2-bromoethyl quinaldine which was reacted with diethylalanine to obtain 2-diethylaminomethyl quinaldine. Its dichlorohydrate, a powder, melted at 207 °C. According to the preliminary pharmacological examinations all three basically substituted heterocyclic compounds showed local anaesthetic activity at least equal to that of novocaine. Moreover the compound 2-diethylaminomethyl quinaldine exhibited antihistaminic and antihadrenergic activity.

anisoyloxyethyl)-(I), can be produced m.p. 177-179°, and N-(beta-veratroyloxyethyl, m.p. 182-184° (both in chloroform-ether), and N-( $\delta$ -3',4',5'-trimethoxybenzoyloxybutyl)-(I), m.p. of hydrochloride 167-169°. Upon the boiling of a solution of (I) with ethylene-chlorhydrin in the presence of  $(C_2H_5)_3N$  and sodium iodide in acetone, N-( $\delta$ -oxyethyl)-(I) is produced; yield of hydrochloride 52-58%, m.p. 192-193° (in chloroform-ether). In order to make comparisons in pharmacological methods by the technique of Smorgonskov-Goldfarb (J. gen. chem. 1940, 10, 1113), the hydrochlorides of ( $\delta$ -oxybutyl)- ( $\delta$ -acetoxybutyl)- and ( $\delta$ -3,4,5 trimethoxybenzoyloxy)-diethylamines, m.p. 88-90, 91-93 and 136-138, respectively, were synthesized. The majority of the above compounds

TITLE :

On the Base-Induced Cleavage of Functional Derivatives of p-Tosylglycine

ORIG. PUB. :

Acta Chim Acad Sci Hung, 17, No 4, 471-474 (1958)

ABSTRACT :

Heating of p-tosylglycine (I) and of its amide (II) to 220-230° with NH<sub>3</sub>, di- and triethylamine leads to the cleavage of I and II and to the formation of p-thiocresol or of the corresponding sulfides and disulfides, amines, aldehydes, and CO<sub>2</sub>. The above reaction takes place when the functionally modified carboxyl group contains readily ionizable [labile] hydrogen. The ethyl ester of I on heating with NH<sub>3</sub>, at first gives II which subsequently cleaves as described above.

Cleavage of *N*-(2,2,2-trifluoroethyl)- and *N*-phenacyl-*p*-toluenesulfonamide with ammonia. M. Lempert-Sréter  
and K. Lempert (L. Eötvös Univ., Budapest). *Acta  
Chim. Acad. Sci. Hung.* 21, 80-90 (1959) (in German).—  
Cleavage of the title compds. was carried out (several hrs.  
at 230-40°) in a sealed tube with aq. NH<sub>3</sub>. In both cases,  
*p*-toluenesulfonamide, m. 135-6°, was obtained (in quant.  
yield from the first title compd. and in 57% yield from the  
second). Thus, cleavage occurred at the C-N bond.

TOPIC TAGS: organic azo compound, organic synthetic compound, ester, organic amide, amine

ABSTRACT:  
Starting from the ester or amide of (2-methylthio-3,4-dihydro-4-oxo-3-quinazolinyl)-acetic acid, various 2,5 (1H, 3H)-imidazo [2,1-b] quinazolinediones substituted in the 1 position have been prepared by ring closure effected by primary amines. Analogously, starting from the corresponding (1-quinazolinyl)-acetamide, 2,5 (1H, 3H)-imidazo [1,2-a] quinazolinediones substituted in position 3 have been synthesized. 1-Alkyl-2-alkylmercapto-4(1H)-quinazolinones, intermediate products used in these syntheses, showed a surprisingly high reactivity with nucleophilic reagents. The authors thank Dr. P. Sohar for the IR and Dr. L. Lang for the UV spectra, Mrs. I. Balogh-Batta and staff for the microanalyses, and Dr. H. E. Duell (Smith Kline and French Laboratories, Philadelphia) for the chemotherapeutic tests. [Orig. art. in Eng.] [JPRS: 33,906]
