Title : Problems of Fruit Cultivation in Moldavia.

Orig Pub : Gradina, via si livada, 1956, 5, No 12, 55-57

Abstract : The climate and soil conditions of the greater part of Moldavia (Rumanian People's Republic) are favorable for fruit cultivation, but in the main the orchards here are separated, which complicates mechanization and good agrotechnique, as a result of which the orchard yield is low. The projected plan for 10 years is to considerably increase the total area of industrial orchards and to increase the area of homestead gardens by 50%. For this purpose a study was conducted of local conditions for developing fruit cultivation and the local varieties of fruit trees.

TITLE: Production of an industrial batch of zeolite driers

PERIODICAL: Khimicheskaya promyshlennost', no. 2, 1962, 71

TEXT: In 1960 it was decided by the Catalyst Department of the Sterlitamakskiy zavod SK (Sterlitamak Plant SK) to produce a zeolite drier of the NaA type according to the process of the VNII NP. Peculiarities of the process: (1) Homogenizing and crystallizing of the sodium-aluminum silica gel are combined in an apparatus with propeller mixing device. Precipitation and crystallization conditions made it possible to obtain crystals of 4 to 6 μ . (2) Washing was performed in a frame filter press with three filter layers. (3) The washed mass was predried in a steam-heated paste mixer. (4) Plasticizing and granulating of the mass were combined in one apparatus. On the basis of studies by the Gor'kovskaya optytnaya baza VNII NP (Gor'kiy Experimental Base of the VNII NP) and the plant, type "K" ("K") clay was used as binding agent.

TITLE: Polymerization of isobutylene in the process of its absorption by sulfuric acid

SOURCE: Neftepererabotka i neftekhimiya, no. 10, 1964, 35-38

TOPIC TAGS: ethylene, isomer, polymerization, chemical absorption, sulfuric acid

Abstract: Investigations were conducted to determine the effect of different concentrations of sulfuric acid and temperatures on the speed of polymerization of isobutylene in the course of the absorption of the latter by the acid.

The method of investigations used was as follows: isobutylsulfuric acid,

obtained from sulfuric acid of a given concentration and isobutylene was maintained at a desired temperature for a period of time; it was then quickly cooled to minus 10 degrees and placed into a centrifuge to separate the polymers from the acid phase; the acid content was then determined and the remaining isobutylene concentration in the acid was calculated. The data indicate that the absolute speed of the polymerization of isobutylene absorbed by sulfuric acid bears no relation to the content of the preparation in the acid, and is

Card 1/2

L 50546-65

ACCESSION NR: AP5015465

not affected by different temperatures and acid concentrations. Further investigations revealed that a rise in the temperature for the intensification of the absorption process is permissible if the concentration of the acid and the period of contact of phases are decreased, and the acid saturation with isobutylene is increased. Orig. art. has 4 graphs and 1 table.

TITLE: Equilibrium distribution of isobutylene between hydrocarbons and sulfuric acid

SOURCE: Neftepererabotka i neftekhimiya, no. 12, 1964, 35-37

TOPIC TAGS: isomer, ethylene, hydrocarbon, sulfuric acid, gas mechanics

Abstract: The equilibrium distribution of isobutylene between H_2SO_4 (at concentrations of 50, 57.3, and 65% by weight) and 92-96% butane at 10-50° was studied. The content of isobutylene in the hydrocarbon gas phase increased with increasing temperatures. At amounts of absorbed isobutylene less than 1 mole per mole of acid, the equilibrium content of isobutylene in the hydrocarbon gas phase increased with decreasing concentrations of acid; at amounts of absorbed isobutylene greater than 1 mole per mole of acid this relation was reversed and the content of isobutylene in the gas phase increased with increasing acid concentrations. The curve expressing the equilibrium content of isobutylene in the gas phase in relation to absorption in H_2SO_4 showed a sharp inflection and steep rise at 1.4-1.8 moles

Card 1/2

L 45750-65

ACCESSION NR: AP5014795

isobutylene absorbed per 1 mole of acid for 65% H_2SO_4 ; the point of inflection was not reached for the lower H_2SO_4 concentrations studied. Similar equilibrium relations were found to apply to the $C_5H_{12} - 1-C_6H_{10} - H_2SO_4$ system. The data obtained correspond with a sufficient degree of accuracy to the equation $y = Ax^B$, where x and y are equilibrium concentrations of isobutylene in the acid and hydrocarbon phase, respectively. For 65% H_2SO_4 , this equation applies up to the point of inflection only.

Orig. art. has 5 graphs.

TITLE: Method for obtaining synthetic rubber. Class 39, No. 175228 ¹⁵ announced by Scientific Research Institute for Petrochemical Products (Nauchno-issledovatel'skiy institut neftekhimicheskikh proizvodstv)

SOURCE: Byulleten' izobrateniy i tovarnykh znakov, no. 19, 1965, 70

TOPIC TAGS: rubber, synthetic rubber, butadiene, methylstyrene, dualin peroxide, copolymer

ABSTRACT: This Author Certificate presents a method for obtaining synthetic rubber by copolymerization of butadiene with α -methylstyrene in an aqueous emulsion at low temperatures in the presence of known emulsifiers, buffers, regulators, stabilizers, and peroxide initiators. To increase the variety of peroxide initiators, decalin peroxide is used as initiator.¹⁵ The decalin peroxide is used in the form of oxidation products of decalinoxidecalin containing 33% decalin peroxide.

cytes in Wiskott-Aldrich Syndrome."

Prague, Casopis Lekaru Ceskych, Vol 105, No 39, 23 Sep 66, pp
1047 - 1052

Abstract [Authors' English summary modified]: The syndrome of
the disease as observed in 2 brothers is discussed; the elder
died at the age of 13, the younger at the age of 2½. Immuno-
chemical examination showed marked changes in immunoglobulins,
with a drop in IgM and an increase in IgA, and the presence of
a paraprotein of the IgG-L type. These and other data indicate
that the disease is a special case of hereditary immunological
disorder. [1 Western 2 Czech references]

Title : On Methods for the Determination of Antibodies Against Leucocytes (A Test of Utilized Complement).

Orig Pub : Vvitrni lekarstvi, 1957, 3, No 3, 215-222.

Abstract : A method is described for determining antibodies from utilized complement. In order to obtain greater sensitivity, leukocytes that had been treated with tannin were used. This reaction probably may be used for determining antibodies against erythrocytes and various tissues.

1307. CLINICAL DIAGNOSIS OF MALIGNANT LYMPHADENOPATHIES - Klinische Diagnostik maligner Lymphadenopathien - Libánský J. Inst. für Haematol. und Bluttransf., Prag - NEOPLASMA 1957, 4/3 (272-282)
A discussion is given of the clinical symptoms and special methods, modern laboratory methods in particular. Their significance and interaction are evaluated. The diagnostic value of puncture of the lymph nodes is especially emphasized and its relationship with the histology of the extirpated lymph nodes is discussed. A detailed description is given of the present stage of methods of examination which make a diagnosis possible when no external lymph nodes are enlarged and the usual diagnostic puncture or extirpation cannot be performed.

význam protilátek proti leukocytům - Libánský J., Chudomel V.,
Ježková Z., and Kout M. Ust. Hematol. a Krevní Transf., Praha -
VNITŘNÍ LÉK. 1959, 5/5 (469-475) Tables 5

Leucocyte antibodies were examined by means of the complement consumption method in 142 patients with various blood diseases. The examination was repeatedly carried out in most cases with the aim to ascertain whether various factors, such as changes in the clinical course, both spontaneous and following treatment, especially with steroids or chemotherapy, or splenectomy, can influence the positivity of leucocyte antibodies. In the course of the investigation, the number of leucocytes in the blood, that of received transfusions and the transfusion reaction were taken into consideration as well. A comparison was made between the complement consumption method and that with leucoagglutinins. The test of comple-

Chlorambucil was used in 18 cases of Hodgkin's disease, 5 of reticular haemoblastoses, 2 of lymphosarcoma and 6 of chronic lymphatic leukaemia. The results were not unsatisfactory. The remissions only last for 2-3 months, however Application is indicated in all cases where X-ray irradiation or other chemotherapy fails. The drug has relatively little toxicity.
