

Vertical Focusing of an Electron Beam  
Using Cylindrical Magnetic Lenses in  
Axially Symmetrical Radially Increasing  
Magnetic Field

77307  
SOV/57-30-2-4/18

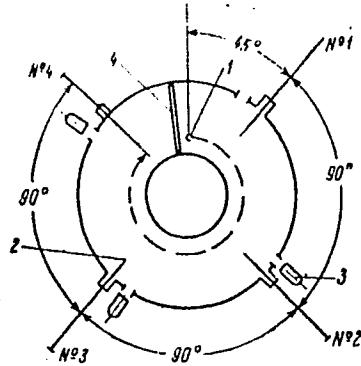

As seen, the entire system is a continuous circuit. The direction of horizontal field components of adjacent magnetic lenses is opposite. The vacuum chamber (4) has an inner radius of 17 cm and an outer of 35 cm. It is 2 cm high. The betatron injector 5 is of standard type with deflector 18 cm from the axis of the system. It could be rotated in the horizontal and vertical plane. The angle of divergence of the beam is 5°. The path of the beam was observed by means of willemite covered screens, while for intensity measurements the screens were replaced by copper plates, and the resulting inhibiting radiation was measured by means of Geiger counters through thin windows covered with thin organic glass (see Fig. 5. The injection was continuous by means of a constant 4 to 8 kev potential. In the case of the 35 cm coil of the guiding field with 8 kev electrons and 1,400

ampere-turns on the coils, the authors found on the screen Nr 4 the beam to be well focused in the radial direction but completely out of focus in the vertical direction. A 300 a current in the focusing device reduced the beam to an approximate circle of 3 mm diam. The screen was at a distance of 24 cm from the axis of symmetry. The authors used the 55 cm coil to measure the average intensity at a fixed equilibrium orbit. The results are on Figs. 8 and 9. On Fig. 9,  $N_2$  and  $N_4$  are the counting rate intensities from

the radiations originating at the screens Nr 2 and Nr 4. One sees that while without focusing the intensity after one half of a turn drops more than 13 times; for currents of more than 300 a the ratio is of the order of unity. There are 9 figures; and 2 Soviet references.

AUTHOR: Kel'man, V.M.; Levchenko, S.I.; Luzyanin, I.D.; Peregud, B.P.

TITLE: Vertical focusing of an electron beam in an axially symmetric radially increasing magnetic field by cylindrical magnetic lenses

SOURCE: Zhurnal tehn.fiz., v.34, no.2, 1964, 321-325

TOPIC TAGS: electron beam, electron beam focusing, magnetic lens, cylindrical magnetic lens, vertical beam focusing, vertical cyclotron beam focusing, cyclotron, accelerator, continuous injection accelerator

ABSTRACT: This paper is the most recent of a series (V.M.Kel'man, B.P.Peregud, K.A.Domatova, ZhTF 28, No.5, 1055-1060, 1958; Yu.V.Vandadurov, Ibid. 28, No.5, 1065-1076, 1958; V.M.Kel'man, B.P.Peregud, K.A.Damatova, I.D.Luzyanin, Ibid. 30, No.2, 153-158, 1960) devoted to discussion of a system for vertical focusing of the beam in a cyclotron or similar device. The focusing system is described in earlier papers of the series. The focusing system consists of a number of cylindrical magnetic lenses located on equally spaced radii of the acceleration chamber. The present paper reports an experimental investigation of the effectiveness of the focusing system by means of

Card 1/3

ACCESSION NR: AP4013421

probe measurements of beam intensity under various conditions. The apparatus (except for the probe, which presents no novel features) was described in an earlier paper. The chamber was 4 cm high and somewhat more than 32 cm in radius. A 5 keV electron beam was employed. The beam current was measured at 135° from the injection point as a function of the current in the focusing lenses. Appropriate excitation of the lenses increased the beam current by a factor of 100. The beam current was measured as a function of the radius with the lenses excited. Six peaks could be distinguished which, by their relative heights, could be correlated with the first six revolutions of the beam. The positions of the beam after each of its first five revolutions were calculated by a method developed in a previous paper. The calculated beam positions agreed very well with the locations of the five highest peaks on the current versus radius curve. The position of the beam after the sixth revolution is not discussed. The following conclusions are drawn: 1) The proposed system assures effective vertical focusing of an electron beam in a radially increasing magnetic field. 2) Formulas developed in an earlier paper can be employed to calculate the behavior of the system. 3) The system can be recommended for use with cyclotrons to increase the beam energy, and for the development of new types of continuous injection accelerators. "The authors express their gratitude to Yu.

At present, the subtype A<sub>1</sub> predominates in the USSR. The antigenic structure of A<sub>1</sub> isolated during the past few years is polymorphic: it is necessary to supplement cross-neutralization by cross-adsorption of antibodies according to a new method developed by the authors. Smorodintsev's rapid method of diagnosing influenza by the reaction of complement fixation is effective in 50% of the cases on sputum examined during the first week after infection; it is less effective on serum. The reaction of hemoag-glutination is effective in 40% of the cases when carried out under proper conditions with the use of human erythrocytes of the O group. It is necessary to produce and supply diagnostic preparations [literally "diagnostica"] equally suitable for hemo-agglutination and complement fixation (dry A, A<sub>1</sub>, and B diagnostica from eluates or infected chicken embryos); to provide dry purified anti-influenza horse sera suitable for both hemoagglutination and complement fixation; to supply from a central point through donor stations, human O-erythrocytes.

Orig Pub : Ezhegodnik. In-t eksperim. med. Akad. med. nauk SSSR, 1955  
L., 1956, 230-235

Abstract : An effort was made to create a single polyvalent grippe virus strain with a complex antigenic structure from 2 strains markedly different from one another in their antigenic and biological properties-- strain A-32 and A<sup>1</sup>-3711. The virus mixture was introduced into the allantoic cavity of hen embryos. After 48 hours of incubation the allantoic liquids were titrated as to RGA (hemagglutination reaction?) and then checked as to RTGA (hem.react. inhibition (?)) with 2 sera against the initial strains. "Virological and Biological Characteristics of Strains of Type B Influenza Virus Isolated in 1955," by T. Ya. Luzyanina and G. A. Aleksandrova, Division of Virology, Institute of Experimental Medicine, Academy of Medical Sciences USSR, Voprosy Virusologii, Vol 1, No 5, Sep/Oct 56, pp 10-15

The etiology of an influenza outbreak in Leningrad during the winter of 1955 was studied. Strains of virus were isolated from patients and analyzed for antigenic and biological characteristics. Methods employed in the following operations are described: isolation of the virus; hemagglutination-inhibition reaction; cross exhaustion of serums with isolated strains; testing of the pathogenicity of the virus in the lungs of white mice; and determination of the toxic properties of the isolated strains.

Results of these investigations are presented in tabular form. The titles of the five tables included are as follows: (1) Cross hemagglutination-inhibition reaction with the isolated strains; (2) Cross exhaustion of immune serums with various strains; (3) Pathogenicity of isolated strains for white mice after 1-4 passages through chick embryos; (4) Death of mice within 1-2 days after the intravenous introduction of influenza virus strains to white mice; (5) Infectiosity for chick embryos and average indexes of the hemagglutination titer after culturing type B strains at varying temperatures.

On the basis of the aforementioned investigations, several conclusions were drawn:

"1. During the 1955 influenza outbreak, ten strains of influenza virus were isolated by introducing human nasal secretions and washings into the amniotic cavity of chick embryos. Seven strains belonged to type B, three to type A".

"2. The type B strains isolated differed sharply from old laboratory type B strains (B-Li and B-28), and were shown to be closer in antigenic relationship to strain BMg, isolated in 1952.

"3. Newly isolated type B strains not passed on chick embryos were markedly pathogenic for white mice. In proportion to passage through the lungs of the mice, the viruses lost pathogenicity for these animals. Passage of the isolated strains on chick embryos sharply decreased their pathogenicity for mice.

"4. The isolated strains were toxic for mice upon intravenous introduction.

"5. Culturing of the infected embryos at 31-32° C considerably increased the infectivity of the virus for chick embryos and the virus titer in the hemagglutination reaction in allantoic fluid."

S/108/60/015/006/010/012/XX  
B010/B070AUTHORS: Ustinova, L. B., Luzyanina, Z. N.TITLE: Correction of the Frequency Response Curve of Broad-band  
Amplifiers With the Help of Positive and Negative Feedback

PERIODICAL: Radiotekhnika, 1960, Vol. 15, No. 6, pp. 24-35

TEXT: The present paper supplements the papers of M. M. Ayzinov, I. A. Suslov, and L. B. Ustinova, and indicates the method of calculation of the optimal parameters of a two-stage broad-band amplifier which is frequency-corrected by the use of positive and negative feedback. Frequency correction with the help of inductance is applied for the purpose of comparison. Using the notations of Table 1, the amplification factor of the frequency-corrected circuits of the table is given by

$$K = \frac{K_0}{a_0 + a_1 x + a_2 x^2 + a_3 x^3}.$$
 This factor may be increased in the region of high

frequencies in comparison to the medium frequencies by feeding back the frequency-dependent output signal to the input of the amplifier. Denoting Card 1/8

the angular frequency of this amplification maximum by  $\omega_2$ , the ratio of the amplification maximum to the amplification of the medium frequencies is given by equation (8):

$$m^2 = \frac{A}{A + B\Omega_2 + C\Omega_2^2 + D\Omega_2^3}, \text{ where } A, B, C, D \text{ are}$$

to be taken from Table 1, and  $\Omega_2 = (\omega_2 RC)^2$  [Abstracter's note: Correctly,  $\Omega_2 = (\omega_2 RC_1)^2$ . Also in Table 1, C should read C<sub>1</sub> at the sign \*]. The quality of a broad-band amplifier is characterized by the product  $K(0)f_2$ , where K(0) is the amplification factor for medium frequencies, and  $f_2 = \omega_2/2\pi$ . This product depends principally on the degree of the polynomial in the denominator of the right-hand side of equation (8), and can be calculated from it. The result is (15):

$$K(0)f_2 = \frac{4}{\sqrt{3}} \cdot \frac{S}{2\pi C_1} \sqrt{K(0)} \cdot \sqrt[4]{1 - \frac{1}{m^2}} \cdot \frac{1}{4\sqrt{C}} \sqrt[4]{\frac{\gamma}{2 - \gamma}} , \text{ where}$$

$$\gamma = \frac{-1 + \sqrt{1 + 3\alpha^2}}{3\alpha}, \text{ and } \alpha = C^2/B^2. \text{ This formula is, thus, seen to have a}$$

structure similar to that of the formula derived by V. Elmor for inductive compensation. The quantities A, B, C, D, and the S/C ratio of the amplifier tubes, and, thus, the whole design of the circuit have to be such that  $K(0)f_2$  has as large a value as possible. The relations for B, C, D given in Table 1 become very much simplified for  $\gamma \approx 0.5$ , where  $K(0)f_2$  reaches its maximum. Then, the following relation holds for the standard case  $m = 1.3$ , the notations being those given in Table 1:

$$\beta n \approx \frac{2}{K_0} (1 - 0.43 \sqrt{a_0}), \text{ and analogous results are obtained for circuits 2}$$

and 3. The process for the design of, say, circuit 1 would be as follows;

Card 3/8

85725

Correction of the Frequency Response Curve  
of Broad-band Amplifiers With the Help of  
Positive and Negative Feedback

S/108/60/015/006/010/012/XX  
B010/B070

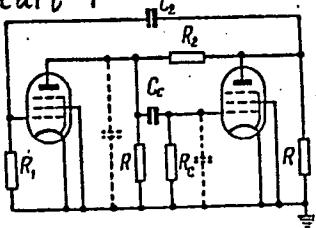

$K(0)$ ,  $m$ ,  $S/C$ , and  $K$  are assumed; the anode resistance  $R$  is obtained from the relation  $R = \sqrt{\frac{K_0}{S^2}}$ ; the negative feedback resistance  $R_2$  is obtained from  $R_2 = \frac{1}{\beta n S}$ ; the value of  $\beta n$  is obtained for the magnitude of the positive feedback, for example, from the above-mentioned approximate formula for  $m = 1.3$ ; from these values and the known internal resistance of the signal sources, the feedback capacitance is fixed:  $C_2 = \beta n R C_1 / R_1 \cdot K(0) f_2$  and the maximum frequency are calculated from formula (15). Finally, two-stage circuits with inductance in the anode circuit and with  $\pi$ -filters are taken for comparison. Their equations for  $K$  contain polynomials of degree 3 and 4, and the corresponding values of  $K(0) f_2$  differ but slightly. They have, however, the advantage over the circuits corrected by mixed feedback that they can be designed to be independent of the internal resistance of the signal source. There are 5 figures, 5 tables, and 4 Soviet references.

TITLE : Results of the Work on the Agricultural Technique of  
Trench Cultivation of Citrus Plants Under the Conditions  
of Moldavia.  
CRIG. PUB. : Izv. Nauk. Cl. AM USSR, 1957, No. 2-3, 35-96  
ABSTRACT : As the result of 6-year work at the Institute of fruit  
Growing, Viticulture and Wine Making, agricultural tech-  
nique has been developed for the trench cultivation of  
lemon in Moldavia where frosts reach -32° and the vegeta-  
tive period with effective temperatures is about 185 days  
instead of 200 necessary for lemon. The best covering for  
the trenches proved to be board panels with 20-cm layer of  
sawdust protected with roofing paper. Earthenware pipes

ORIG. PUB.	:	
ABSTRACT	:	After a period of heat, irrigating the soil of the trenches with the residue of pressed grapes moderates it to the extremes of temperature and moisture. In summer, the trenches were shaded with cheesecloth for the period from 11 a.m. to 5 p.m. stripes between the trenches were sown with leguminous companion crops. The best method of irrigation proved to be the vertical-furrowing method with a band of peat or brushwood placed on three sides of the basin. From fertilizers, the best effect was produced by N at the rate of 30 g of active element to 1 bushel together with the organic fertilizers. -- S... Retyayev

L'vin, Ya. B.  
✓ 3032. L'vin, Ya. B., Calculation of cylindrical shell subject  
to cyclic edge effects (in Russian), *Inzhener. Sbornik, Akad.*  
*Nauk SSSR* 9, 113-130, 1951.

Author investigates a space structure of the bunker type composed of two different thin-walled shells of revolution. The upper shell is circular and is joined to the larger end of another shell having the form of a truncated cone. At the juncture of the shells is a ring which is supported by columns equally spaced on its periphery. Function of the ring is to distribute the reaction forces and reduce stress concentrations in the shell at points of support.

Starting with Vlasov's equations for shells, author achieves simplification by reducing the eighth-order partial differential equation with real coefficients to a complex one of fourth order and, because of cyclical symmetry, the equation becomes ordinary. Roots of the characteristic equation are found, but no results are approximate; two terms in the series expansion being used.

to cyclic edge effects (in Russian), *Inzhener. Sbornik, Akad.*  
*Nauk SSSR* 17, 59-68, 1953.

Author gives exact solution to a space structure previously discussed by him. The structure is of the bunker type with a circular cylindrical shell above joined by a ring to the larger end of a truncated conical shell. The ring is supported by columns equally spaced on its periphery. The purpose of the ring is to distribute the reaction forces of the columns, thus reducing the stress concentration in the cylindrical shell.

Detailed discussion and general principles needed to solve the problem are given in author's first paper (see preceding review) which is indispensable to understanding the discussion in this work.

Title : Experience in the Acclimatization of Bulls of the Senta Gertrude Breed in the Astrakhan' Oblast' (Opyt akklumatzatsii bykov sneta gertrude v Astrakhanskoy oblasti)

Orig Pub : Zhivotnovodstvo, 1957, No 5, 76-77

Abstract : The article reports on the acclimatization of two bulls of the Senta Gertrude breed in the region of the Il'mon' steppe of the Caspian lowland. During the first three months, the bulls almost did not touch green fodder, but subsequently began to get used to it and were eating all grass, even such which local cattle did not eat. During the summer, the bulls were fed 20-30 kg. of the green mass of sown grass, 8-10 kg. of freshly mowed hay, and 5-6 kg. of combined feeds. At pasturing time, the bulls were keeping together. Their state of health was good and they were developing normally. The bulls were found

Title : The Effect of an Active Immunization Against Intestinal In-  
fections and Tuberculosis on the Resistance of Animals to  
Radio [Radium?].

Orig Pub : Med. radiologiya, 1957, 2, No 5, 65-72

Abstract : A study was made of a preliminary one stage immunization of mice by tetra-vaccine or by the BTsZh vaccine, on the course of radiation sickness caused by an irradiation of Roentgen Rays of 400 ch. or by the introduction of polonium (0.1 microcurie per kilogram). An immunization of this type, especially when made 2 weeks prior to exposure to Roentgen Rays, increases the animals chances of survival (irradiation) or increases their life span (polonium). A preliminary vaccination, made 4 times on rabbits who had received formalin treated

690. THE EFFECT OF GAMMA RAYS ON THE CAPSULES OF FRIEDLANDER'S  
BACILLI (Russian text) - Lvitsina G. M. - MED.RADIOL. 1958, 3/5  
(68-71) Illus. 5

The action of massive doses of  $\gamma$ -rays was studied on the modification of the morphological properties of the capsule in a typical strain of Friedlander's bacilli. The change of the size of the capsules was observed in smears prepared by the Burri-Gin method. The external appearance of the irradiated cultures was also studied. It was demonstrated that irradiation of the 24-hr. culture with the dose of 600,000 r. produces a significant decrease in the size of the cell and of its capsule.

690

Irradiation by  $\gamma$ -rays in the doses of 600,000 r. and 200,000 r. resulted in the change of external appearance of Friedländer's bacilli in the agar and broth cultures, liquefaction and loss of viscosity of the agar cultures, disappearance of the membrane and complete clearance of the broth.
