

On Thermodynamics of Steel Crystallization in the Mold

66503

SA/137-59-7-14595

occurs. If, however, the process is accompanied by deep supercooling, the thermodynamic potential is considerable and a certain portion of the energy reserve is consumed by forming crystallization centers. The first case is considered as the thermodynamical basis for the theory of subsequent crystallization; the second case pertains to the theory of volume crystallization. It is concluded that these theories can not be opposed.

AUTHOR: Madyanov, A.M.

TITLE: Quantitative characteristic of crystallization zones in the process of steel hardening in the casting mold

PERIODICAL: Referativnyy zhurnal. Metallurgiya, no. 11, 1961, 61, abstract
11V358 (V sb. "Metallovedeniye i term. obrabotka", Gor'kiy, 1959,
5 - 9)

TEXT: To investigate the tertiary hardening process of steel in the casting mold the method of simulation was applied, based on the thermal-hydraulic analogy. The data obtained make it possible to represent graphically the quantitative variation of the crystallization zone with the passage of time. Curves divide the entire field of the diagram into three regions corresponding to the dimensions of the crystallization zones: the zone of solidified metal, the crystallization zone, and the zone of molten metal. Starting with this diagram, it is possible to characterize the conditions of the crystallization of steel as a function of the viscosity of the medium for any ingot cross section. The comparison of the diagram of the crystalline inhomogeneity of the ingot and the graph of the quanti-

Quantitative characteristic ...

tative variation of the zone as it hardens makes it possible to establish the influence of zones upon the structural inhomogeneity of the ingot. The zone of fine grained crystals corresponds to the period of steel hardening at the lowest thickness of the heterogeneous zone. In the formation of the transcrystallization zone, there arise conditions favoring the growth of spiky crystals; their crystallization occurs at definite ratio of the rate and the temperature gradient. The axial zone of the ingot is formed before the final hardening out of the heterogeneous medium of greater viscosity. The rise of zonal liquation is accompanied by the vanishing of the molten metal zone. The final formation of liquation strips in the metal occurs in the heterogeneous zone. The calculation of the critical crystallization rate at which liquation strips occur is shown, using the solidus.

TITLE: Dimensions of crystallization zones and their effect on the heterogeneity of forged ingots

PERIODICAL: Referativnyy zhurnal. Metallurgiya, no. 3, 1961, 44, abstract 3V31⁴
(V sb. "Puti uluchsheniya kachestva otlivok". Gor'kiy, 1959, 156-
164) ✓

TEXT: Data from the method of thermohydraulic analogy were used to plot a diagram on changes of crystallization zones of an ingot in the mold, which makes it possible to determine the dimensions of the crystallization zone for different sections of the ingot at any moment of solidification. It was found that the zone of fine-globular crystals corresponded to that period of steel solidification when the thickness of the heterogeneous zone has the least value. The zone of transcrystallization is located so that it begins at a certain magnitude of the heterogeneous zone and ends with the vanishing of the liquid metal zone. During this period columnar crystals are being formed. The axial section of the

ingot (coarse-globular crystals) is formed without a liquid metal zone, when all this metal volume, prior to final solidification, represents a heterogeneous medium of considerable viscosity. The formation of off-axial segregation is accompanied by the varnishing of the liquid metal zone. The formation of segregational streaks takes place in the heterogeneous zone. ✓

PURPOSE: This book is intended for the technical personnel
 of foundries. It may be used by students of the field.

CONTENTS: This collection of articles discusses problems in
 founding processes. Individual articles treat the melting
 of metals and their alloys, mechanization and automation
 of casting processes, aspects of the manufacture of steel
 castings, and nonferrous metal castings. No personalities
 are mentioned. References accompany individual articles.

TITLE. Comparing the chemical heterogeneity of an 8-ton ingot of a new shape with a bulk ingot

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 2, 1962, 42, abstract 2V256
(V sb. "Novoye v litye. proiz-ve. no. 3", Gor'kiy, 1960, 238-240)

TEXT: A medium carbon steel ingot (0.41 - 0.53% C) of a new shape is different from a bulk ingot by a lower H : D. To compare the chemical heterogeneities of both ingots, a chemical analysis was made for C, P and S in samples taken off longitudinal and transverse templets. It was established that the new ingot shows a lesser range of changes in the C, P and S concentration over the height in the axial section, than the bulk ingot. ✓

Title : Polarographic Determination of Univalent Copper in the Presence of Bivalent Cu in an Ammoniacal Solution of Univalent Copper Acetate.

Orig Pub : Chem. prumysl. 1957, 7, No 6, 299-300

Abstract : A polarographic method for the Cu^+ determination is suggested which makes possible the simultaneous determination of Cu^{2+} . The results of the polarographic Cu^+ determination are in good agreement with data obtained by the titrimetric method and can be used for its control. The polarogram is run with 1N $NH_4OH + 1N NH_4Cl$ as the supporting electrolyte.

ABSTRACT: An automatic-control system in which the sampled signal is used for
both controlling the actuator and forming the control law is theoretically
considered. It is assumed that: The plant is first-order linear; The sampling
period is much longer than the total time of control operations. It is found that
considerable deviations from the absolute optimum do not seriously affect system

L 2613-66

ACCESSION NR: AP5019720

accuracy; the latter increases up to a certain value of gain; beyond that value, the extremum-tracking error becomes higher again because of the increased hunting amplitude. Recommendations for selecting the optimal system gain are given. Formulas are developed for the steady-state error of the sampling-data system subjected to noise; in these formulas, the plant inertia is allowed for.

ABSTRACT: The main indices of the quality of the gradient system for automatic optimization can be the mathematical expectation and the dispersion of the output channel. The indices are functions of the parameters of the controlling part of the system, that is functions of the coefficients of the working and trial steps. An additional correcting automatic optimization system is introduced to effect automatic choice of the parameters on the basis of minimization

2

of the certain statistical quality criterion of the control system. The automatic optimization system with correcting unit includes the block for the analysis of the statistics, a block for the quality criterion, and an automatic optimizer for the adjustment of the parameters, whose output acts on the settings of the coefficients of trial and working steps. The statistics-analysis block calculates the mathematical excitation and the dispersion of the output coordinate, the quality-criterion block calculates the statistical criterion of quality in accordance with a specified algorithm.

TITLE: Random signal generators intended for studying automatic systems

SOURCE: Ref. zh. Avtomatika, telemekhanika i vychislitel'naya tekhnika, Abs. 11A88

REF SOURCE: Tr. Mosk. energ. in-ta, vyp. 59, 1965, 229-243

TOPIC TAGS: random signal generator, automatic control, automatic control system, automatic control theory

ABSTRACT: The problem of generating random processes with required characteristics (spectral density and distribution density) is considered; it arises in simulator studies of automatic control systems subject to various random influences. Methods are described for generating time-quantized processes with characteristics close to those of white noise, in a finite infralow-frequency band. The correlation function of such a process is investigated. A method is given for selecting parameters of a forming filter, when the dispersion and approximation error values are specified. Certain methods for generating the random processes are set forth: a method based on selecting and recording a h-f periodic process at time moments separated by random intervals; a method for generating binary noise (generalized telegraph signal); a method for generating a pseudo-random process with arbitrary discrete distribution. Circuits of random-process generators designed with operational amplifiers, Polak trigger, and step switches are presented. Seven figures. Bibliography of 12 titles.

TOPIC TAGS: random process, spectral distribution, automatic control, design, random noise signal, correlation function, very low frequency

ABSTRACT: The problem considered is that of obtaining random processes having stipulated statistical characteristics (spectral density and distribution density), occurring during the investigation of automatic devices subjected to various types of random signals. Methods are described for obtaining processes with time quantization and with characteristics close to those of "white noise" in a certain finite range of infralow frequencies (0 - 10 Hz). The correlation function of such a process is investigated. A method is proposed for selecting the parameters of the shaping filter for specified values of dispersion and approximation error. Certain methods are developed for obtaining the considered random processes, viz., a random-process generation method based on the choice and fixation of the values of a high frequency periodic process at the instants of time separated by random intervals, a method for obtaining a binary noise (generalized telegraph signal), and a method for obtaining a pseudorandom process with arbitrary discrete distribution. TITLE: Application of elements of the theory of statistical decisions to problems of optimal search in discrete systems of automatic optimization

SOURCE: Moscow. Institut avtomatiki i telemekhaniki. Samoobuchayushchiesya avtomaticheskiye sistemy (Self-instructing automatic systems). Moscow, Izd-vo Nauka, 1966, 266-272

TOPIC TAGS: optimal automatic control, automatic control theory, control statistics

ABSTRACT: The presence of intense disturbances at the output of a controlled system is the cause for an inaccurate determination of the index of the extremum which leads to the appearance of false motions in the system. The change from continuous random variables to their discrete analogs when solving the problem of selection between two hypotheses stems from the development of techniques of discrete computation on digital computers. The use of discrete control is sometimes the only possible control for systems with complex dynamics. The technique of averaging statistical data substantially depends upon the character and level of the

Card 1/2

L 05280-67
ACC NR: AT6022693

noise. There is an optimal value of the number of search measurements at which the transient period is minimal. The effect of averaging is especially noticeable at a high noise level in comparison with the useful signal. For $\epsilon > 1$ the decrease of search time will not be large, but in return the probability of the appearance of false steps will always be smaller in comparison with all other methods of processing statistical data. In this case the established error will also be minimal. To some extent this justifies the complication of the logic and circuitry of the computer performing Val'd's successive procedure (Posledovatel'nyy analiz. Fizmatgiz, 1960). In most cases it was assumed in this investigation that the static characteristic of the controlled system was piecewise-linear. This is far from true, but on the other hand it substantially simplifies the analytical investigation. The "stability" of the upper and lower thresholds for a sufficiently wide range of change of the coefficient of slope of the statistical characteristic in the vicinity of the operating point makes it possible to form a sequential analysis of the values of the mathematical expectation of a random variable for any real characteristic of the controlled plant, which is still another advantage of Val'd's method. Abstract : Over a five-year period three spinach varieties (Zimmiy krupnyy, Viktoriya, and Matador) were tested on the vegetable selection and seed-production station in the village of Negovan, Sofiyskiy rayon, and a study was made of several related agricultural engineering problems. Matador proved to be the best variety (the average yield being 105 centners/hectare). The highest yields were acquired when the spinach was sown as a winter crop on a

Abstract : The results of tests of different watermelon varieties at the selection and vegetable crops seed growing station in the Neopryan village (Bulgaria) in 1954-1955 are given in this paper. Watermelons of the Maromnyy (standard), Slavyanka, Linonka, Archarka, Marshovskiy, Vilkovskiy and Louskiy varieties were sown, with vetch and peas, as preceding crops. The distance between rows was 1.5 m and the distance among plants in a row was 1 m. Maximum yield (227 cwt/ha) was obtained with the Slavyanka variety. It gave 40-50% more yield than the standard crop, but the size

Abstract: Senior author has long been advocating use of single but large doses of combined penicillins to prolong penicillemia beyond that achievable with the commonly used 600,000 units daily for 3 days in streptococcal throat infections. Comprehensive clinical data are now reported on 11 and 7 children treated with the two methods. Results confirm that the combined single massive dose is superior in preventing recurrence, increasing antistreptolysin titers and in other ways improving the clinical conditions.

Abstract: of the annual 8000 tons [metric] of butter produced in Bulgaria, 2000 are exported to England, both Germanys, Czechoslovakia and some Near Eastern and African countries. Yet hygienic conditions in its production are very heterogeneous, poor care in many areas forces destruction of much valuable butter even apart from the frequent lack of good refrigeration and other storage facilities. Some of the major remediable defects and ways to correct them are described and discussed.

An attempt was made to establish data for the differential diagnosis between genuine and pseudo-tumours of the brain. Fifteen patients were studied. The anamnesis revealed that all patients with pseudo-tumours had suffered from a fever or infection. The affection was characterized by a chronic course, with headaches persisting for years. Half the cases showed slight papillary stasis. Study of the CSF, psychopathological examination and PEG made it possible to distinguish between

June 59

the residual manifestations of infectious encephalitis and cerebral tumour. The mounting intracranial pressure in certain inflammatory affections caused disturbances of the higher nervous activities, leading to deafness, somnolence, indolence and apathy. In some cases there were also disturbances of memory, distraction, and bad moods with aspects of asthenic depression. In encephalitis, the focal symptoms manifested themselves more weakly than in cases of tumour, and often showed a more diffuse character. When manifestations of meningo-encephalitic sequelae are associated with mounting intracranial pressure and progressive aggravation of the patient's condition, decompressive trepanation is indicated. This measure, however, must only be resorted to when the various methods of dehydration have proved unsuccessful.

TOPIC TAGS: automatic control system, automatic search, optimal automatic search (55)

TRANSLATION: It is pointed out that a random noise at the measuring-element input of an extremal system increases the time of extremum search. The probability of a false searching step can be reduced by a statistical averaging of several controlled-hunting steps, which makes these steps longer and, therefore, increases the total search time. It is noted that the Wald method of statistical sequential analysis is the optimum method with respect to the acceptable number of hunting steps consistent with a sufficiently short search time. This method investigates the random process by observing it and by setting up hypotheses.

L 6375Q-65

ACCESSION NR: AR5003344

about the nature of the process (for example, choosing between two solutions of two alternative situations). The method is peculiar in that it involves (a) a multistage statistical experiment and (b) the decision to desist or continue the experiment depending on a random previous step. Examples are given that illustrate the utilization of the obtained results. Bibliography: 3 titles

TITLE: Classification of clinical forms of brucellosis

SOURCE: Meditsinskiy zhurnal Uzbekistana, no. 6, 1965, 55-58

TOPIC TAGS: brucellosis, clinical medicine

ABSTRACT: The five stage classification developed by N. I. Ragoza 25 years ago now requires the addition of a 6th stage. The five stages are the first latent, acute septic, septic-metastatic, chronic, and second latent, all described in the article. In the chronic stage, a primary and secondary form must be differentiated, the latter having identical but milder symptoms. The new 6th stage includes metabrucellosic changes and para-allergic post-brucellosic clinically residual signs. The metabrucellosis is characterized by rare organic changes in the liver, spleen, and peripheral nervous system. The residual signs occur after bacteriologic recovery, have a functional character, and consist of various

TITLE: Latent brucellosis

SOURCE: Meditsinskiy zhurnal Uzbekistana, no. 7, 1965, 28-31

TOPIC TAGS: brucellosis, infective disease, epidemiology, animal disease

ABSTRACT: Essentially healthy people with positive seroallergic reactions are relatively frequently found in epidemic foci brucellosis. Such reactions are sometimes a manifestation of the primary latent form of brucellosis, sometimes a sign of resistance to infection resulting from natural immunity. The symptoms of the primary latent form of brucellosis are very faint in a number of individuals, and are expressed as slight enlargement of the liver, spleen, and lymph nodes, autonomic

disturbances (hidrosis, bradycardia), vague pain in the extremities. The length of time the positive reaction persists depends on local enzootic conditions. In places where positively-reacting individuals are exposed to repeated super- and reinfections, the seroallergic reactions may remain positive a long time owing to the penetration of new brucellas into the body (additional antigenic stimulation). But when there is no possibility of super- or reinfection, the seroallergic reactions gradually subside and disappear.

Abstract : In 1954-1955 at the All-Union Experimental Rice Station in Krasnodar the development of the growth cone /konus narastaniya/ of the late-ripening sort UZROS-269 was observed. A description of 12 stages of the organogenesis of the rice raceme is given. The influence of the amount of illumination, as well as its intensity and quality, on the speed with which the rice passed through various stages was

of organogenesis. During the fourth and fifth stages increasing the temperature to 28-35° (the temperature of the control being 20-25°) speeded up development by two or three days, and there was also a sharp rise in the number of ears as well as in the amount of grain which they contained. Reducing the temperature (to 15° or 20°) had the opposite effect.

panicles, analogous to the stages of wheat organogenesis as determined by F. N. Kuperman. In the first stage (undifferentiated growth cone) neither length nor intensity of illumination, nor the quality of the light had any effect on tempi of morphogenesis; this stage lasted about 12 days in all variants. In the second and third stages (before the panicles put out branches, and before the ear tubercles form) the plants require a short day. Lengthening the day severely retarded the completion of the second stage. In the fourth stage (when the panicles and ear tubercles put out branches) the plants' light needs are in the blue-violet part of the spectrum. In the sixth stage (differentiation of sporogenous tissues)

the degree of illumination is of overriding significance for the plants. Raising the temperature of the covering layer of water accelerates completion of the fourth and fifth stages, causes a sharp increase in the number of ears, and heightens the fertility of the flowers; reducing the temperature after the light stage causes a sharp decline in the number of ears and the amount of grain they contain. -- G. N. Chernov

REF SOURCE: Tr. Karakalpaks. gos. ped. int., vyp. 2, 1964, 235-244

TOPIC TAGS: copper, aluminum, crystal deformation, plastic deformation, tensile strength, crystal lattice distortion

ABSTRACT: Experimental results are presented of an investigation of the structural changes occurring on large tension deformations of single crystals of Cu with different orientations. The character of the disorientation of the blocks produced during the deformation is clarified. The difference between the deformation structure of the crystals with different orientations is established, and also the difference between the deformation structures of Cu and Al crystals with identical orientations. In Cu crystals with orientation of the axis along the (105) direction, at large deformations, regions were observed in which disorientation of the lattice takes place, this disorientation being close in character to the case of formation of deformation twins. An estimate is made of the upper limit of the variation of the lattice parameter. An essentially different deformation structure is obtained in the region of the neck compared with the remaining part of the crystal. [Translation of abstract]

TITLE: X-ray study of defects in single crystals of aluminum and copper with low uniaxial tensile deformation

SOURCE: Fizika metallov i metallovedeniye, v. 19, no. 3, 1965, 349-353

TOPIC TAGS: tensile property, single crystal deformation, dislocation effect, x ray scattering

ABSTRACT: Anomalous scattering of x-rays by single crystals of aluminum (99.98%) and copper (99.96%) which had been uniaxially deformed to 0.5-1% is photographically analyzed. It is shown that slight deformation causes diffusive scattering of x-rays which can be studied only as scattering due to dislocation defects. In the case of copper this scattering may be due to dislocation loops. There is a considerable difference in the scattering patterns of single crystals of each material which is explained by the difference in anisotropy. Although the results are considered preliminary, it is shown that defects caused by small deformations may be

studied by the method of anomalous scattering in single crystals. Future investigations should be directed toward an examination of lattices with various directions of deformation and the construction of a theory of scattering with concrete models of dislocation configurations. TITLE: Duct for transporting (principally pneumatic) devices. Class 81, No. 176822

SOURCE: Byulleten' izobreteny i tovarnykh znakov, no. 23, 1965, 94

TOPIC TAGS: pipeline ~~+~~, pneumatic device, hydraulic equipment

ABSTRACT: This Author Certificate presents a duct for transporting (principally pneumatic) devices. The duct includes a fixed and a movable fitting which are interconnected with rings placed in a plane inclined to the axes of the fittings (see Fig. 1). To provide the motion of the movable fitting in the plane of the fitting axes, the fittings are coupled with rings using additional fittings which are rotatable or counterrotatable and are interconnected with arms. The arms are rigidly fastened to each of the fittings respectively and are swivel-coupled together. The axis of the swivel is in the plane of rotation of the rings. The drive of the additional fittings is accomplished with hydraulic cylinders fastened
