402 Ionization phenomena in solid insulators  
M. MARSHAL, *J. Phys. Chem. Pol. m.*, 42, No. 3, 141-6  
1950, *In Slovak.*

In an earlier paper Heller and Veverka investigated ionization phenomena in solid insulators [Abstr. 401 (1950)] by applying a relatively simple equivalent circuit. In this paper investigations of ionization phenomena on more complicated equivalent circuits and on a real dielectric are described. The author found that ionization phenomena in inhomogeneous insulators are of a statistical nature and that the character of the loss angle/voltage curve gives some indication of the internal structure of the dielectric.

065 SOME CONSIDERATIONS ON THE STABILITY OF  
THE INSULATION OF POWER CABLES M. Marsal  
Electrotech. Obzor, Vol. 14, No. 2, 45-66 (1969) Czech.

The ageing processes in cable insulation are considered  
in the following order: (a) chemical processes, (b) electrical  
phenomena, particularly the relation between gradient on  
conductor surface and diameter of strands; (c) temperature  
and pressure conditions in cables and their influence on ioniza-  
tion processes. Ageing is retarded by preventing formation of  
cavities in the insulation, and by using carbon-black paper to  
reduce the stresses on the conductor surface

181. A SIMPLIFIED METHOD FOR THE CALCULATION OF  
FORCES REQUIRED TO PULL CABLES INTO PIPES AND DUCTS.  
M. MARSAL

Electrotech. Časopis, Vol. 48, No. 8, 395-392 (1957). In Czech.

The factors that determine the magnitude of the forces required are reviewed as follows: effective friction coefficient, a quantity defined for the case when several cables are pulled through a circular cross-sectional duct and arranged in a definite configuration; weight of the cable, length and the profile of the ductline. It is suggested that the total length of the ductline is divided into sections of simple geometries and the force necessary to overcome the friction in each section calculated. Tables are given to take account of the path profiles by a geometrical friction coefficient. Effective friction coefficients are given in a table and families of curves. The force necessary for the installation of 110 kV oil-filled cable for a given duct is calculated as an illustration of the method.

TITLE: Theory of extreme values and its application to the evaluation of the electrical strength of insulation 15

SOURCE: Elektrotechnicky casopis, no. 6, 1965, 322-332

TOPIC TAGS: electric insulation, asymptotic property

ABSTRACT: A short review of the theory of extreme values is given, mainly of the so-called exact and asymptotic theory, the properties of the three types of the asymptotic distribution of extremes (the exponential, the Cauchy and the limited) are described, and examples of their application in the investigation of the electrical strength of insulation in homogeneous and inhomogeneous fields are discussed. TOPIC TAGS: cat, cerebral cortex, brain neurology, encephalology, cytology

ABSTRACT: In the area of motor, premotor, and prefrontal cortex of the cat the origin, course, and endings of the frontothalamic connections were investigated. Corticothalamic connections start in the motor and premotor area of brain cortex, pass through capsula interna into nucleus reticularis thalami, continue through lamina medullaris externa into nucleus ventralis posterolateralis, n.v. lateralis, n. centralis lateralis, n. paracentralis, and n. centralis medialis. From part of the motor cortex connections reach n. ventralis lateralis. From premotor area they reach the upper half of n. ventralis anterior. Processes and changes caused by damage to the connections are described. The medial area of prefrontal granular cortex is connected to n. reticularis, n. dorsomedialis, n. ventralis lateralis and posteromedialis, and n. centralis lateralis. Orig. art. has: 6 figures. ABSTRACT: Motor area of the frontal cortex of dog is directly connected to n. hypothalamicus lateralis, n. perifornicalis, and n. hypothalamicus posterior. The premotor area is not directly connected to the nuclei of supraoptical and tuberal group. The upper part of the prefrontal granular cortex is connected directly to n. praopticus lateralis. Frontopolar granular cortex is connected directly to the preoptical group. Position of frontothalamic connections is described. It must be assumed that nucleus hypothalamicus lateralis is an important connecting link for the direct frontothalamic connections. Orig. art. has: 6 figures. [JPRS]

ABSTRACT: A relatively simple, yet accurate (to within  $\pm 1$  relative %) oscillometer for high-frequency titration purposes, capable of being assembled from generally available components, was described. The principal components of the device include a selenium rectifier, a transformer, four electronic tubes, an adjustable condenser, titration cell, and vacuum-tube voltmeter. If the voltmeter has a recorder output, the device can be used for recording. The construction, operation, performance, and applications of the device were described and illustrated with schematic diagrams and drawings. It can be modified for measuring frequency differences. Out of 2232 deliveries during the last year 2.8% of new-born children had to be treated for purulent conjunctivitis after prophylactic instillation of 5% protargol, but no instance of gonorrhoeal conjunctivitis was observed. None the less it is felt that Crède's method cannot be abandoned. Blennorrhoea of the lachrymal sac was observed in 2.00% of new-born children. In the diagnosis of toxæmia of pregnancy the importance of dynamometric assessment of the retinal blood pressure is emphasized.

Title : The Excretion of Gonadotropins After Dilatation  
of the Cervix Uteri in Women Suffering from Amenor-  
rhea.

Orig Pub: Ceskosl. gynacol., 1957, 22, No 5, 352-354

Abstract: In women with amenorrhea, the dilatation of cervix uteri induced an increase or decrease of the excretion of gonadotropins (G). In women who reacted with a decrease of G excretion, menstruation occurred after 3-12 days, while in those in whom the G excretion increased, amenorrhea persisted.

816. DIFFERENTIAL DIAGNOSIS OF HIRSUTISM - Beitrag zur Differentialdiagnose des Hirsutismus - Maršálek J., Talaš M., Novosad D., and Bartošová L. Frauenklin. and the Dermatol. Klin. Palack Univ. Olomouc - ARCH. GYNÄK. 1957, 188/5 (443-456) Graphs 6

Extensive chemical and radiological examination of 23 women with hirsutism (3 cases of adrenocortical hirsutism, 6 of ovarian hirsutism, 14 of familial hirsutism). The skin function was determined by determining the quantitative changes of the sebum according to the method of Fiser-Lorenz-Graham. In some cases the excretion of pregnanediol, gonadotrophins, 17-ketosteroids (fractionated) and oestrogens was investigated during the entire cycle. In addition the Thorn test and Charval's cholesterol test were performed. When the excretion of 17-ketosteroids was high the cortisone test was carried out. Endometrial biopsy was done on the first day of menstruation. In agreement with other signs of increased seborrhoea a noticeably increased sebum level was found in patients with ovarian and familial hirsutism as compared with patients with adrenocortical hirsutism. Menstruating patients with ovarian hirsutism had anovulatory cycles. In 3 of these patients the growth of the beard decreased slightly after wedge resections of the ovaries. The growth of the beard in a patient with familial hirsutism decreased by the use of 25 mg. of cortisone daily for 2 months, followed by the same dose every other day.

Marsálek J. and Obručník M. Porodn.-Gynekol. Klin., Lék. Fak.  
Palackého Univ., Olomouc - ACTA UNIV. PALAK. OLOMUCENSIS 1958,  
15/14 (253-260) Illus. 8

A report on changes in the location and concentration of carbohydrates in the ovaries in cases of Stein-Leventhal syndrome. The most significant changes are accumulation of acid mucopolysaccharides and mucoproteins in the perifibrillar sheath of coarsened collagenic fibres and in the interfibrillary cement substance of the tunica albuginea. They are also present in the media of arteries of the cortex and medulla where they are associated with secondarily deposited collagen and hyaline, and lastly in the cells of growing follicles, in which they are in granular form. The luteinized thecal cells contain hardly any carbohydrates. The cause of these changes is considered to be a dysequilibrium in the neurohumoral reactions, followed by suppression of tissue hyaluronidase activity in the ovary. In the Stein-Leventhal syndrome a correlation exists between the intensity of the symptoms and the duration of hirsutism on the one hand and the intensity of the chemical changes on the other.

TITLE: Start-up preparations of the first large-space coke oven battery in  
Czechoslovakia

SOURCE: Hutnicke listy, no. 4, 1965, 229-233

TOPIC TAGS: industrial furnace, coke, industrial plant

## ABSTRACT:

Production units included in the overall plant are described. Training of operators before the start-up is discussed. Detailed operating instructions for the start-up and for the erection are described. The importance of preliminary operating instruction classes before the actual start up date are evaluated. Details of the necessary preparation of the units for the commercial start-up are reviewed. The function of erection engineers in the overall plant start-up is discussed.
