Title: Theoretical Determination of the Fine Structure of Atoms of the Boron Type

Original Periodical: Lietuvos TSR Mokslu akad. darbai, 1956, B2, 15-19, Lithuanian
resume

Abstract: The doublet splitting of the terms of 4 atoms of the boron type is determined in the principal configurations both with the aid of the single-electron wave functions of the Fok self-consistent field, as well as with the aid of the analytic wave function. The theoretical results are compared with the experimental data.

Title : Theoretical Determination of Fine Structure of Atoms of
B Type

Orig Pub : Lietuvos TSR mosklu akad. darbai, Tr. AN LitSSR, 1956,
Vol B2, 15-19 (Lithuanian summary)

Abstract : The doublet splitting of the ground state terms of four
B type atoms has been calculated both on the basis of
one-electron wave functions derived from Fock's self-
consistent field and on the basis of analytical wave
functions. The theoretical results are compared with
experimental data.

Lithium atom

SOURCE: AN Lit SSR. Litovskiy fizicheskiy sbornik. v.1, no.1-2, 1961, 97-100

TOPIC TAGS: Lithium, Lithium valence electron, Fok - self-consistent field,
atomic energy level, Li

ABSTRACT: This theoretical paper is a continuation of studies previously performed by the author, jointly with E. Mauza, A. Jucys, and K. Zukauskas (Vilnius valstybinis universitetas, V. V. U.), Mokslo darbai, v. XI(VI), 1956, 13, and v. XVI(VII), 1957, 45, on the solution of the simplified Fok equation for Lithium-type atoms and on the application of Fok's self-consistent field to the determination of the doublet splitting of the terms of the same type, and by the author and K. Zukauskas (V. V. U., Mokslo darbai, v. XVI(VII), 1957, 37). In the present paper, the simplified method set forth in the first cited reference is employed to solve the equation of Fok's self-consistent field for the valence electron 6d of the Lithium atom. The single-electron radial wave function of

Card 1/2

1-17990-61

ACCESSION NR: AT3002107

Fok's self-consistent field thus obtained is employed to determine the double splitting of the term of the configuration $1s^2 2d$. The selection of this configuration of the Li atom is based on the possibility afforded thereby to make a comparison between theoretical and experimental results in this case. Experimental data employed in the present study are taken from C. E. Moore, Atomic Energy Levels, v.1, Nat'l Bu. Stand., Washington, D.C., 1949. Orig. art. has: 3 tables and 1 formula.

TITLE: High-frequency mass spectrometer

PERIODICAL: Matematicko-fyzikálny časopis, no. 1, 1963, 72 - 79

TEXT: A description is given of a high-frequency mass spectrometer of the Bennet type with a three-stage analyzer, which can be used for the study of ion formation in gas discharges and determination of the absolute age of minerals by the Ar-K method. The spectrometer contains a hot cathode, 17 grids and a collector. There are two field-free spaces, 5 and 7-cyclic. The spectrometer is tuned to various mass numbers by adjusting the frequency between 2 and 5.2 Mc/s. The motor which adjusts the frequency of the oscillator also moves the paper in the recorder which registers the amplified collector current. The rectified high-frequency voltage is used as a reference for the stabilized retarding potential. This arrangement ensures a constant ratio between these two voltages and thus keeps the resolving power constant. The electron emission current and all other potentials are also stabilized. The grids are fabricated from 10- μ tungsten wires, brazed 0.2 mm apart.

Card 1/3

Z/045/63/000/001/002/003
E024/E309

High-frequency mass spectrometer

across the aperture of a circular disc. The outer diameter of the disc is 53 mm, the aperture is 30 mm and it is made of molybdenum sheet, 0.55 mm thick. The brazing of the wires to form the grids is achieved by first winding the wire onto a steel frame with suitable notches. The frame is placed on the molybdenum disc, which had been coated with gold solder in a hydrogen atmosphere, and the gold is melted with the aid of a small tungsten heater, again in a hydrogen atmosphere. When the wires are thus brazed they are cut off at the edges of the disc. The critical parameters of the brazing operation are the distance of the heater from the disc, the flow of hydrogen, the temperature of the heater and the duration of the heating. All these parameters were determined experimentally. If desired, two discs can be brazed onto one wire frame in successive operations, so that after cutting the wires two grids are obtained from one frame. The distance of the grids in the analyzer was chosen as 3.57 mm and was obtained with the aid of glass spacers to an accuracy of 0.04 mm. The length of the first field-free space was 40.95 ± 0.1 mm and that of the second was 60.25 ± 0.1 mm. The total length of the spectrometer, exclusive of leads, was 280 mm and its diameter was 70 mm. It is essential that the high-frequency

Card 2/3

High-frequency mass spectrometer ...

Z/045/65/000/001/002/005
E024/E309

potential should be a pure sine wave. This is achieved by taking the output of the oscillator from a cathode follower. To reduce the Miller effect, two further parallel cathode-followers are used. The high-frequency potential was 8 V_{rf}. The compensating potential was 16 V. The ratio $K = U_B/4.5 U_0 = 0.96$ (U_B is the potential of the retarding grid and U_0 is the peak value of the high-frequency voltage). With these values a theoretical and experimental resolving power of about 27 is obtained. The sensitivity for ^{36}Ar is 2×10^{-2} vol.%. At a total pressure of 1×10^{-5} torr, a partial pressure of 8×10^{-9} torr of Ar, corresponding to an ion current of about 10^{-13} A, can be measured.

TITLE: The Tesla KNK6 transistorized short-distance telecommunication system. The Tesla KNK6 short-distance transistorized telecommunication installation

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika no. 1, 1962, abstract 1-8-3 i (Kovo export (CSR), 1962, no. 7, 17-22)

TEXT: A description of a 6-channel HF telephony equipment for short distance lines (economical for distances of 10 - 20 km) is given. The linear equipment spectrum occupies a frequency band from 12 to 124 kc/s; group A - the frequency band from 16 to 60 kc/s and group B the band from 76 to 120 kc/s. The actually transmitted channel frequency band is 300 - 3400 c/s, the 3850 c/s frequency being used for signalling. To simplify filter circuitry the carriers are spaced by 8 kc/s. The system uses the speech signals compounding and it may thus be used with unpupinized AF cables without

additional HF characteristic equalization. The equipment is transistorized and has printed circuits. An automatic switchover from a 2-wire to a 4-wire line, operated by a switchboard operator, is incorporated. The finished equipment is manufactured as a console on which are placed the individual and group units together with the auxiliary equipment for 24 channels. The IF amplifiers are hermetically sealed. A bloc-diagram of the equipment and its electrical and structural characteristics are given. ✓ Abstracter's note: Complete translation. 7

Chem

The article deals with the sources of fibre damage caused by oxidation dyes and with the possibilities of overcoming them. Salts formed by aniline with organic acids were prepared and the quality of the oxidizing agent, the temperature and time of oxidation and the catalyst were varied. Fibre degradation was evaluated by breaking strength tests. In the absence of mineral acids black colour did not develop. After the experiments with aniline salts tests were carried out with derivatives from which mineral acid is liberated during the oxidation but only to the degree necessary for oxidation. The salts of aromatic amines with sulphamic acid were selected for this purpose; however only in a pure state can they be used without causing fibre damages. The raw product contains impurities from which acid is liberated during the hydrolysis thereby causing fibre degradation. During the course of the experiments with *p*-tolyl-sulphamic acid the authors also prepared the pigment itself and investigated whether this pigment could be used directly for printing. In respect to particle size the pigment was found to meet the requirements. The fastness of the printed samples was satisfactory.

Preparation and separation of chlorinated benzene derivatives of high boiling point. István Rusznák, Endre Marton, and György Bakta (Műszaki Egyetem, Budapest). Magyar Kem. Lapja 11, 123-5 (1956).—Distn. by-products of the monochlorobenzene manuf. were studied with the purpose of developing a method for the sepn. of 1,2,4-trichlorobenzene (I) for the prepn. of phthalocyanine. The material contains ~5% Cl. It was distd. in vacuo (19 mm. Hg) at 32-80° to obtain the light portion; at the latter temp. p-dichlorobenzene pptd. At 81-152° the high-boiling portion was obtained. Both portions were then redistd. at atm. pressure. The light portion contained no I, the high-boiling portion contained ~60%. As the high-boiling portion represents 26% of the total distillate, it was attempted to increase I yield by chlorinating the light portion. Fe catalyst was used and the chlorination was conducted at 20-30° until sp. gr. reached 1.220 (20°) and at 55-65° until it reached 1.335 (50°). The I yield can be further increased by continuing the chlorination until reaching the sp. gr. 1.460 (50°). G. J. Ernyei

From the viewpoint of operability 3 categories are distinguished. The following technical observations are made: (1) In intrathoracic operations it is often important to adapt the patient's position to the direction and other characteristics of the injury. (2) In major myocardial defects, implantation of a free muscular flap is recommended. (3) In injuries close to a coronary vessel the use of a mattress suture seems efficacious to prevent ischaemia. (4) For treatment of pulmonary injuries ligation is unsuitable; only sutures should be applied. (5) In view of the relatively important reduction of the respiratory function in mild injuries treated conservatively or semisurgically, the question arises whether it would not be more efficacious to employ surgical evacuation.

Budapest, Orvosi Hetilap, Vol 107, No 35, 28 Aug 66, pages 1647-1649.

Abstract: [Author's Hungarian summary] Based on the evaluation of the data of 16 young (under 40 years of age) patients with lung carcinoma, the diagnostic and therapeutic problems are discussed along with the results of an early evaluation of the cases which were operated on and of the conclusions which can be arrived at. 7 Eastern European, 7 Western references.

The effect of acid and alkaline feed on the growth of mouse carcinoma. I. MAR-
TON, O. MAGANY AND A. LEANER. Magyar Orvosi Archivum 31, 59-64 (1930). The
growth of transplanted mouse carcinoma is retarded by food conta. $(\text{NH}_4)_2\text{HPO}_4$, or
 $(\text{NH}_4)\text{H}_2\text{PO}_4$, which are known to cause acidosis. On the other hand, tumor growth is
accelerated by food conta. NaHCO_3 , which causes alkalosis. II. TAUBER

MARTON, I.

✓ Effect of change of the effective circulating blood volume on renal salt excretion and diureals by normal men and patients with decompensated heart disease: Gy. Szabó, M. Poldi, F. Solti, J. Rév, I. Marton, and K. Tornyos (IV. Clinic, Budapest). *Acta Med. Acad. Sci. Hung.* 10, 1-14 (1958) (in German). — In normal men reduction of circulating blood vol. reduced the glomerular filtration rate and water and salt excretion. Stimulation of circulation increased the filtration rate and excretion. Patients with decompensated heart disease and edema reacted in the

opposite way: increasing the circulating blood flow decreased the filtration rate and the excretion of water and salts and decreasing the flow increased the rate and excretion. Cf. following abstract. H. L. Williams
