TITLE: On a Certain Generalization of the Variation Method
(O nekotorm obobshchenii variatsionnogo metoda)

PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol. 117, Nr. 3, pp. 374-377 (USSR)

ABSTRACT: Let the linear operator A in the equation
(1) $Au = f \quad f \in H$
be defined on a set being dense in H and let it admit the representation
(2) $A = A_0 A_1$
where A_0 is selfadjoint and A_1 is closed. The operator A with the representation (2) is called positive in the generalized sense if for every element $u \in D(A)$ being different from zero there holds:
(3) $(Au, A_1 u) > 0.$
Let
(4) $\Phi(u) = (Au, A_1 u) - (A_1 u, f) - (f, A_1 u), \quad u \in D(A).$
The proposed generalization bases on the Theorem: If A is positive in the generalized sense, then the

Card 1/3

On a Certain Generalization of the Variation Method

20-3-5/52

solution of (1) is equivalent to the determination of that element of $u \in D(A)$ for which the functional $\Phi(u)$ reaches a minimum.

A is called positive-definite in the generalized sense if for every $u \in D(A)$ there holds:

$$(5) \quad (Au, A_1 u) \geq \gamma^2 \|u\|^2, \quad \gamma > 0$$

$$\|A_1 u\|^2 \leq C^2 (Au, A_1 u), \quad C > 0.$$

Let the operator A being positive-definite in the generalized sense be defined on the set $M = D(A)$ being dense in H . Let the scalar product in M be

$$(6) \quad [u, v]_1 = (Au, A_1 v) \quad u, v \in M.$$

Let the closure of M in the sense of the metric (6) be the space H_1 .

Theorem: All elements of H_1 belong to H too.

Theorem: In order that the sequence $\{\varphi_n\}$, $\varphi_n \in D(A)$ is complete in H_1 , it is sufficient that $\{A \varphi_n\}$ is complete in H .

Card 2/3

On a Certain Generalization of the Variation Method

20-3-5/52

Let the sequence $\{u_n\}$, $u_n \in D(A)$ have the property that

$$\lim_{n \rightarrow \infty} \Phi(u_n) = \inf \Phi(u)$$

Theorem: If A is positive-definite in the generalized sense, then every sequence $\{u_n\}$ with the above property in the space H_1 converges to an element which gives a minimum to the functional $\Phi(u)$.

Theorem: If A is positive-definite in the generalized sense, then the Ritz method converges for (1) in H_1 .

Here, in the last theorem, the Ritz method means a certain generalization of the classical method.

Some New Applications of the Methods of the Type of Galerkin
Matematicheskiy sbornik, 1959, Vol 49, Nr 1, pp 85-106 (USSR)PERIODICAL: Matematicheskiy sbornik, 1959, Vol 49, Nr 1, pp 85-106 (USSR)
ABSTRACT: The author investigates the method of B.G.Galerkin generalized by G.I.Petrov [Ref 7] and N.I.Fel'skiy [Ref 8], for the special case where this generalization is equivalent to the momentum method of N.L.Krylov. The author gives several examples for this method, called the Galerkin-Krylov-method, e.g. the solution of

$$(-1)^{l-1} u^{(n)} + \sum_{k=0}^l p_k(x) u^{(k)} = f(x), \quad l = \frac{n+1}{2}$$

$$u(a) = u'(a) = \dots = u^{(l-1)}(a) = 0, \quad u'(b) = u''(b) = \dots = u^{(l-1)}(b) = 0.$$

It is proved that the region of applicability of the method is essentially greater than that of the Galerkin-method. The author thanks S.G.Mikhlin for the revision of the manuscript. He mentions G.A.Zhdanov, and S.L.Sobolev.
There are 9 Soviet references.

AUTHOR: Martynyuk, A.Ye.TITLE: Application of the Galerkin-Method and the Galerkin-Momentum-Method
to Some Partial Differential Equations of the Type of I.N.Vekua. 10PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Matematika, 1960,
Nr.3, pp.186-204TEXT: § 1 has an introducing character. For the proof of the convergence
of the method of Galerkin for equations of the type ✓

(1) $Au + Ku = f, \quad f \in H, \quad D(K) \supset D(A)$

the author recommends the scheme of S.G.Mikhlin (Ref.4): It has to be
 proved that 1) the operator A is positive definite and selfadjoint on a
 certain set of functions and 2) the operator $T = A^{-1}K$ is completely
 continuous in a certain Hilbert space H_0 which corresponds to A . Besides,
 the author proves the auxiliary theorem: Let the finite region Ω of the
 (x,y) -plane be bounded by a smooth, central symmetrical curve S . Then the
 inequation

(4)
$$\int_{\Omega} \int (\delta u)^2 d\Omega \geq \gamma^2 \int_{\Omega} u^2 d\Omega, \quad \gamma > 0$$

C111/C222

Application of the Galerkin-Method and the Galerkin-Momentum-Method to
 Some Partail Differential Equations of the Type of I.N.Vekua
 is valid for every function $u(x,y)$ continuous in $\bar{\Omega} = \Omega + S$ together with
 $\delta u = \frac{\partial u}{\partial x} + \frac{\partial u}{\partial y}$ and vanishing on S .

In § 2 the author considers the boundary value problem

$$(L) \quad (-1)^s \delta^m u + \sum_{k=0}^{m-1} a_k(x,y) \delta^k u = f(x,y), \quad m \geq 1$$

$$s = \begin{cases} 1, & m \text{ even} \\ -1, & m \text{ odd} \end{cases}, \quad l = \left[\frac{m+1}{2} \right],$$

$$(1) \quad u|_S = 0, \quad \delta u|_S = 0, \dots, \delta^{l-1} u|_S = 0 \quad \text{for } m \text{ even}$$

$$(2) \quad u|_{S_1} = 0, \quad \delta u|_{S_1} = 0, \dots, \delta^{l-1} u|_{S_1} = 0 \quad \text{for } m \text{ odd.}$$

It is assumed: 1) Ω is bounded by a smooth central symmetrical curve S ;
 S_1 be one of the halfs of S which one obtains by cutting S with a straight
 line $y = -x + \alpha$, where α is chosen so that this straight line passes through
 Card 2/6

85929

S/140/60/000/003/008/011

C111/C222

Application of the Galerkin-Method and the Galerkin-Momentum-Method to
Some Partail Differential Equations of the Type of I.N.Vekua
the center of symmetry of S; 2) the coefficients a_0 to a_1 are continuous,
the a_{l+1} to a_{m-1} are sufficiently often differentiable in $\bar{\Omega}$. If m is odd,
then let besides be

$$(3) \quad \delta^h a_{k+h}(x,y) \Big|_{S-S_1} = 0; \quad k = l+1, l+2, \dots, m-h-1; \quad h=0, 1, \dots, l-3.$$

3) $f(x,y)$ be continuous in $\bar{\Omega}$; 4) The boundary value problem has a unique solution. Under these assumptions the author investigates the convergence of the method of Galerkin (for m - even) and the momentum method of Galerkin (for m - odd) for the application to the given problem. The author denotes: $Au = (-1)^s \delta^m u$, $A_1 u = \delta u$, $Kf = \sum_{k=0}^{m-1} a_k(x,y) \delta^k u$. The region of

definition of A is the set $M_0(M_1)$ of the functions continuous in $\bar{\Omega}$ together with δu and satisfying (1) (resp.(2)). If m is even, then with the aid of the above auxiliary theorem it is shown that A on M_0 is positive definite

Card 3/6

85829

S/140/60/000/003/008/011

C111/C222

Application of the Galerkin-Method and the Galerkin-Momentum-Method to
Some Partial Differential Equations of the Type of I.N.Vekua
and selfadjoint (in the sense of Lagrange). If m is odd, then Δ is
positive definite on M_1 , in the generalized sense; according to the author
(Ref.2), for the proof of convergence of the momentum method of Galerkin,
this replaces the first claim of Mikhlin (Ref.4) (cf. above). Now the author
introduces the spaces H_0 (resp. H_1) with the scalar product $[u, v]_0 = (Au, v) =$
 $= (-1)^m (\delta^m u, v); u, v \in M_0$ (resp. $[u, v]_1 = (\Delta u, \Delta v) = (-1)^{m+1} (\delta^{m+1} u, \delta v); u, v \in M_1$)
and it is stated that the operator $T = A^{-1} K$ is completely continuous in
 H_0 (resp. H_1). Herewith the convergence of the investigated methods is
proved for an application to the formulated boundary value problem.
Uniform convergence holds only for $m \geq 3$. An effective construction of the
Green's function of the operator A is given for $m=2, m=3$, where a
coordinate system is used which is turned by 45° .
In § 3 the author proves, with the same scheme, the convergence of the
method of Galerkin for the boundary value problem

TITLE: Certain new criteria for convergence of the method of successive approximations

SOURCE: Ref. zh. Matematika, Abs. 12B622

REF SOURCE: Uch. zap. Kazansk. un-t, v. 124, no. 6, 1964, 183-188

TOPIC TAGS: successive approximation, approximation convergence, operator equation

ABSTRACT: The author establishes general criteria for direct application of the method of successive approximations to a fairly wide class of operator equations with unbounded operators. Let A be a positive definite (in the generalized sense) operator, with domain of definition $D(A)$ dense in H , which can be represented in the form of the product

$$A = A_0 A_\alpha \quad (1)$$

where A_0 is a self adjoint and A_α a closed operator. Corresponding to the operator A , one introduces the auxiliary Hilbert space H_α with norm

$$\|u\|_\alpha^2 = (Au, A_0 u), u \in D(A) \quad (1A)$$

and considers the linear equation

$$Au + Ku = f, D(K) \supset D(A), f \in H. \quad (2)$$

UDC: 518:517.948

Card 1/2

L 45403-66
ACC NR: AR6016620

To establish conditions for unique solvability of equation (2) and to find approximate solutions to (2), one uses the method of successive approximations. The following theorem is proven: Let A be a positive definite (in the generalized sense) operator represented in the form (1), and let K be a closed operator satisfying the condition

$$\|Ku\|^2 < \frac{q^2}{\|A_0^{-1}\|} (Au, A_0 u), 0 < q < 1; \quad (3)$$

then equation (2) is uniquely solvable, and the method of successive approximations for this equation converges in the space H_α . Varying the operator A_α , one can obtain various special forms of inequality (3), which is a simple and practical criterion for unique solvability of linear differential equations of form (2) and convergence of the given method of successive approximations for these equations. A convenient formula is obtained for estimating error. Some applications of the theorem to ordinary linear differential equations are given (2nd and 3rd order equations are investigated). A numerical example is presented which shows that in the given case convergence of the method of successive approximations is faster than convergence of the method of Galerkin. SUB CODE: 12

ABSTRACT: In an earlier paper the author presented a method for successive approximations of the equation $Au + Ku = f$, $D(K) \subset D(A)$, $F \in H$, related only to the highest operator A , which he calls the method of A -successive approximations (simply, the A -method). In this paper he established the convergence criteria of the A -method for the operator equation: $Au - Ku = f$, $D(K) \subset D(A)$, $f \in H$, (1) with a generally linear operator K . The element $u_0 = A^{-1}$ is taken as the zero approximation of equation (1), and the Galerkin-Krylov method is combined with the successive approximation method and applied to (1) both in the usual way and in the A -form. The inverse operation A^{-1} is definite in the entire Hilbert space H , which is real, complete, and separable. The methods evolved are applied to an ordinary second-order equation such as (1). Two theorems are given which can be applied to other nonlinear differential equations of the form (1) of any order including the first. Orig. art. has: 32 formulas. JPRS: 40,050

TITLE: Investigation of dislocation structure and the propagation of dislocations in cadmium crystals

SOURCE: Kristallografiya, v. 8, no. 3, 1963, 405-412

TOPIC TAGS: Frank-Read source, hexagonal crystals, Cd, dislocations, Burgers vector, slip band

ABSTRACT: Because the literature is unclear on how points are provided for pinning dislocations to supply a beginning for a Frank-Read source, the authors have undertaken an analysis of possible intersections and interactions of dislocations in hexagonal crystals. They have made experimental tests by selective etching to determine dislocations, and they conclude that hexagonal crystals have favorable conditions for the formation of points that pin dislocations during plastic deformation. They conclude further that the restraint on dislocations to move in planes of the prism or the second-order pyramid considerably exceeds the restraint on movement in the basal plane, which impedes transverse slipping. Thus, during plastic deformation in hexagonal crystals, dislocations apparently

Cord 1/2

L 12797-63

Title : Utilizing Fish Silage for Fattening of Swine.

Orig Pub : Byul. nauchno-tekhn. infor. Del'nevo t. n.vi. in-ta s. kh.
1957, 3, 33-34

Abstract : One group of pig, chosen for being fattened, was given corn-fish silage (50 percent of corn, 50 percent of fresh fish), and the second group of pig was fed corn-fish silage in layers (70-80 gr of corn, 20-30 gr of fish). The third group of pigs served as a control group. Average daily weight gain amounted to 528 gr, 573 gr, and 520 gr for each group, respectively. Fodder expenditures per each kg of weight increased amounted to 6.0, 6.9, and 7.2 feed units for each of the 3 groups, respectively.

U.S.S.R. ✓ 5509. ELECTRICAL CONDUCTIVITY OF UNSTEADY FLAME AT REDUCED PRESSURE.
Rossikhin, L.D., Matrosova, N.N., Martynok, L.A. and Tsiklava, I.I.
(Nauch. Zap. Dnepropetrovsk. Gos. Univ., Ser. 7, v. -Ref. Fiz. (Sci. Notes Dnepropetrovsk
Dnepropetrovsk. Gos. Univ., Sborn. fiz.-mat. Fiz. (Sci. Notes Dnepropetrovsk
Univ., Bull. phys. math. Fac.), 1953, vol. 41, p. 12; abstr. in Ref. Zr,
Khim. (Ref. J. Chem., Moscow), 1954, (17), 39282). Experiments in 1948 had
shown that conductivity of flames in acetylene/air mixtures depends mainly
on conductivity of the inner cone. Experiments are now recorded with a
moving flame in a cylinder of 15 mm diameter and 20 mm length with two
longitudinal condenser plates of 0.0075 micro F capacity charged to 100 V.
The charge remaining in the condenser after it had been discharged to V_0
on the passage of the flame was measured with a ballistic galvanometer,
and the time spent by the flame between the electrodes was calculated from
 $V_0 = 100 \exp(-t/\tau_C)$. The minimum time corresponded to 12% acetylene and
maximum current to 10-12% acetylene. Change in current and in number of
charged particles with pressure up to 380 mm mercury is expressed by $I = cV^2$,
which is evidence of the bimolecular character of the ionization process.
This is the lack of correspondence between change in current on the one
hand and composition and temperature of flame on the other. Indicated the
importance of chemical reaction in the process of ionization.

AUTHORS: Martynyuk, M.M., Machionis, Z.A., Yerofeyev, B.V., Semenchenko, V.K.

TITLE: Compressibility of polystyrene and poly- α -methyl-styrene and its dependence on the molecular weight

PERIODICAL: Doklady Akademii nauk SSSR, v. 7, no. 3, 1963, 170 - 173

TEXT: The temperature dependence of the compressibilities of polystyrenes of the molecular weights of 1,000, 4,100, 7,300, 23,900, 37,500, 141,000, and 613,900, and of the poly- α -methyl styrenes of the molecular weights of 606,800 and 54,800 was measured by way of reducing the pressure in the range from 400 to 200 kg/cm², as described by M.M. Martynyuk and V.K. Semenchenko (Kolloidnyy zhurnal, v. 25, no. 2, 1963). The monomers were subjected to anionic polymerization according to Schwarz, and their molecular weights measured in toluene with an Ubbelohde-type viscometer described by S.R. Rafikov (Vysokomolekulyarnyye soyedineniya, v. 1, 1,558, 1959), while those of the polymers up to 7,300 were determined cryoscopically in benzene. The polystyrene samples were pressed and slowly cooled at 400 kg/cm² and 180 to 220°C in dependence on the molecular

Compressibility of polystyrene and

weight, and at 260°C for poly- α -methyl polystyrene. Thermal destruction of the polymers was 18% on the average, the structures being completely amorphous according to x-ray data. The three highest-molecular polystyrenes and the poly- α -methyl styrenes showed practically uniform compressibilities. Three temperature regions were established on the compressibility curves, namely a) that of low compressibility independent of temperature; b) the intermediate one with a fast increase of compressibility with temperature; and c) that of high compressibility showing a linear increase with temperature. The compressibilities of polystyrenes with molecular weights in excess of 30,000 can be given for temperatures above 110°C by the equation:

$$-10^6 \left(\frac{\partial v}{\partial p} \right)_T = (t - 110) 0.233 + 49,$$

where t is given in °C, and

$$- \left(\frac{\partial v}{\partial p} \right)_T = \frac{1}{m} \left(\frac{\partial V}{\partial p} \right)_T \text{ cm}^3/\text{g-atm},$$

with v being the specific volume and V the volume. The corresponding equation for poly- α -methyl styrene with M in excess of 55,000 and temperatures above

Card 2/3

S/250/63/007/003/006/006

Compressibility of polystyrenes and

180°C is

$$- 10^6 \left(\frac{\partial V}{\partial P} \right)_T = (t - 180) 0.2 + 52.$$

Three characteristic points are found on the compressibility curve of the amorphous polymers, i.e., a) the end point t_1 of the first region after which the compressibility increases; b) the initial point t_2 of the third region after which a linear dependence of the compressibility is established; and c) the inflection point t_1' , where the compressibility is half the sum of the compressibilities at the points t_1 and t_2 . t_1 for polystyrenes of molecular weights in excess of 35,000 is practically independent at about 101°C, while, for lower-molecular polymers, the equation $t_1 = 6.6 \ln M + 32$ holds. The polydispersity of the sample was experimentally shown to have no marked effect on the compressibility curve of high-molecular polymers. L.M. Kantorovich and F.M. Rapoport are mentioned. There are 2 figures and 1 table.

TITLE:

Investigation of the Phase Diagram Nickel-Molybdenum-Chromium
(Issledovaniye diagrammy sostoyaniya nikel'-molibden-khrom)

PERIODICAL:

Zhurnal Neorganicheskoy Khimii, 1958, Vol. 3, Nr 4,
pp. 853-859 (USSR)

ABSTRACT:

The nickel corner in the phase diagram of the system Ni-Mo-Cr (up to 40% molybdenum and up to 40% chromium) was investigated using the thermal and microscopic analysis. Eight polythermal sections of the nickel corner in the phase diagram nickel-molybdenum-chromium were constructed. The phase composition and the hardness of the alloys were investigated at temperatures of 1270°, 1200°, 950°, 800° and 700°C. The saturation limit of the ternary solid solution of the basis of nickel was determined at temperatures of 700°, 800°, 950° and 1000°C. It was shown that with a drop of temperature the solubility of molybdenum and chromium in nickel decreases markedly. Also the sectional diagrams with a constant content of 4%, 8,5%, 3,5% and 20% of chromium were constructed.

87 18

SOURCE: Moscow. Gosudarstvennyy nauchno-issledovatel'skiy i proyektnyy institut splavov i obrabotki tsvetnykh metallov. Trudy, no. 24, 1965. Metallovedeniye i obrabotka tsvetnykh metallov i splavov (Metal science and the treatment of non-ferrous metals and alloys), 324-332

TOPIC TAGS: titanium, titanium alloy, metal heat treatment, nonferrous metal alloy/ VT-5D alloy

ABSTRACT: The object of the investigation was to determine the effect of temperature and duration of annealing in air on the microhardness of technical titanium and alloy VT-5D. The microhardness and the microstructure of the specimens were

Card 1/3

L 24431-66

ACC NR: AT6006485

determined after annealing in air at various temperatures (from 700 to 1200°C) over a period of 15--360 minutes. Several photographs of polished sections of the specimens are presented. The experimental results are presented in graphs and tables (see Fig. 1).

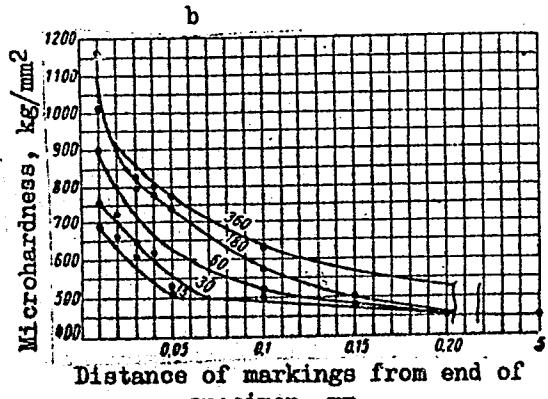

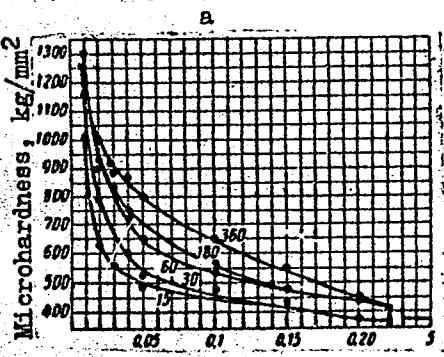

Fig. 1. Change in microhardness of specimens in different zones as a function of the period and temperature of annealing. Specimens were annealed at 1200°C for 15,

Card 2/3

L 24431-66

ACC NR: AT6006485

30, 60, 180, and 360 minutes and quenched in water. a - technical titanium; b - alloy VT-5D.

It was found that during annealing of technical titanium at 700C the diffusion layer formed on its surface was of negligible thickness, but that the rate of formation and thickness of the diffusion layer increased with increase in the duration and temperature of annealing. Annealing of the alloy VT-5D at 800C resulted in a slow formation of a brittle surface layer. It is therefore recommended that intermediate products manufactured from alloy VT-5D should be cold-worked at temperatures of 600--800C. It was found that the rate of formation of the diffusion layer is more rapid in α titanium than in β -titanium, and that the allotropic transformation $\alpha \rightarrow \beta$ takes place at $\sim 900C$ in technical titanium and at $\sim 1000C$ in the alloy VT-5D. Orig. art. has: 3 tables and 9 graphs.

AUTHOR: Martynyuk, V.V. (Moscow)

TITLE: Investigating certain classes of functions in multi-valued logics

SOURCE: Problemy kibernetiki, no. 3, Moscow, 1960, 43.

TEXT: The author proves the precompleteness of certain classes of functions. After giving some definitions of basic concepts in the theory of multivalued logic, the concept of monotonicity relative to partial ordering is introduced. In connection with this a certain set of functional classes is implicitly defined as a generalization of the classes of monotonic functions, and it is proved that these classes are not identical. The criterion of precompleteness is formulated for a class which is a member of this set (the formulation of this criterion was communicated to the author without proof by A.V. Kuznetsov). The necessary and sufficient nature of the criterion is proved. Finally, the criterion of precompleteness is proved for the functional class T_{EsR} which is a generalization

Card 1/4

S/582/60/000/003/002.001
D222/D305

Investigating certain classes of ...

of the classes T_E s investigated by S. V. Yablonskiy (Ref. 1). Trudy Matem. in-ta AN SSSR, 51, 1957). A class of N functions of k -valued logic is called precomplete if a system of functions of N is k-valued logic, but whatever function $f(x_1, \dots, x_n)$ N is added to the complete. If for any sequences $\alpha = (\alpha_1, \dots, \alpha_n)$ and $\beta = (\beta_1, \dots, \beta_n)$ such that $\alpha \leq \beta$, the relationship $f(\alpha) \leq f(\beta)$ is fulfilled. The class of all functions of k -valued logic monotonic with respect to r is called the class M_r . Theorem 1 states that if r_1 and r_2 are different partial orderings, then M_{r_1} and M_{r_2} are identical if, and only if, $r_1 \sim r_2$. Here \sim denotes an ordering in which the same pair $a \leq b$ numbers are comparable as in r_1 and if $a \not\leq b$, then $b \not\leq a$. Theorem is proved for the cases: a) When one of the orderings is trivial; b) When both orderings are nontrivial and there is a pair of different numbers comparable with respect to r_1 and r_2 ; c) When both

Card 2/4

S/582/60/000/003/002 009
D222/D305

Investigating certain classes of ...

derings are nontrivial and there is no pair of numbers comparable with respect to both orderings. A quasi-permutation is defined as a partial ordering which has one minimal and one maximal element. Theorem 2 states that in order that the class M_r be precomplete it is necessary and sufficient that the partial ordering r be a quasi-permutation. The class T_{EsR} is defined as follows: If each argument x_i of the functions $f(x_1, \dots, x_n)$ takes all its possible values from $\epsilon_1, \dots, \epsilon_s$ of R , then the function $f(x_1, \dots, x_n)$ takes its values only from E and from not more than s different classes ϵ_i . ϵ_s of R . Here E is a non-empty subset of the set of numbers $\epsilon_1, \dots, \epsilon_k$. The remaining numbers of this set, ϵ_k , are divided into non-empty subsets $\epsilon_1, \dots, \epsilon_l$. The aggregate of subsets is denoted by R . If the subsets $\epsilon_1, \dots, \epsilon_l$ contain one number each, then the class T_{EsR} is identical to the class T_{Es} of S.V. Yablonksiy. Theorem 3 states that if $0 < s < l$, then the class T_{EsR} is precom-

TITLE:

The relation between memory and certain possibilities
of a finite automaton

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika,
no. 7, 1962, abstract 7-2-151 d (In collection: Probl.
kibernetiki, no. 5, M., Fizmatgiz, 1961, 87 - 96)

TEXT: Potentiality (effectiveness) of a computer is understood as
the maximum complexity of test problems that it can solve. The ef-
fectiveness of a computer (automaton) is assessed for the concrete
class of test problems, suggested by A.A. Lyapunov. A finite auto-
maton R is defined as an object with a finite number $M \geq 1$ of sta-
tes a_1, \dots, a_M and a finite number (≥ 1) of input signals. The ma-
ximum possible effectiveness $L(M) = \text{Max} [H(M, N)]$, where $H(M, N)$ is
the maximum possible effectiveness of an automation with M states
and N signals. An automaton is said to have effective numbers in
the case when a signal, differing from s received signals, is cha-
racterized by the final state of the automation, i.e. by the con-

The relation between memory and ...

tents of the memory of the computer. By designing concrete automata, lower and upper estimates, defined in terms of effectiveness, are found for the maximum possible effectiveness $L(M)$. It is shown that an estimate of the function $I(s)$ follows directly from the estimates obtained above for the function $L(M)$, where $I(s)$ is the minimum number of states that suffices for an automaton with this number of states to possess effectiveness s . It is pointed out that the results obtained can be extended to the case when a finite automaton passes from one state to another not under the action of a single signal but under the action of a set of a certain number of signals. TITLE. On the economical allocation of memory

PERIODICAL. Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki, v. 2, no. 3, 1962, 445-458

TEXT The procedure is intended for automatic programming; the programmed algorithm is assumed to be reduced to an operator scheme. The first step consists in computing the incompatibility matrix. Two quantities are incompatible when the intersection of their activity domain contains an operator working on at least one of them. For scalar quantities, the problem is then reduced to that of colouring the vertices of the incompatibility graph with the minimum number of colors. The method consists in joining in succession, one matrix to a non-adjacent vertex which is adjacent to the maximum number of vertices adjacent to the first vertex. For non scalar quantities, there is the supplementary condition that successive elements must be stored in successive cells. Each possible joining of one non scalar with another determines a new incompatibility matrix. The evaluating function ψ of this matrix is taken to be $\psi = p/m$, where p is the number of edges and m the number of vertices of the incompatibility graph.

ABSTRACT: To make a more economical analysis of operator circuits it is desirable to introduce supplementary *a priori* information into the operator algorithm in order to eliminate the possibility of excluding input quantities which might, in combination, theoretically lead to error, but which actually cannot occur at all in a given sequence. For this purpose, a formal language of canonical assumptions is given in order to allow the statement of a necessary property for each operator sequence. Having practical interest are those properties which lead to a logically contradictory combination in the transfer circuit from an operator to its successor. It is proved that for any operator circuit Π and any canonical assumption K the set of sequences of Π for which the predicate K is valid is a regular

Card 1/2

L 56439-65

occurrence. If a regular occurrence R in a finite alphabet \mathcal{M} consists of words beginning with the same symbol and ending with the same symbol, then there exists an operator circuit Π_R , all sequences of which are in correspondence with the set R . Thus the analysis of operator circuits with supplementary *a priori* information reduces to an analysis without such information. Operations for constructing closure and reverse closure are formulated and an algorithm presented for executing them. A method is described for the formal expansion of operator circuits into units. 1964, 963-967

TOPIC TAGS: memory core, cybernetics, computer, digital computer, memory address

ABSTRACT: The authors describe a machine operation which allows the dynamic transfer of information into operating memory in the time of 3 to 4 elementary logical operations, thus gaining significant savings in computation time for long problems. The hardware configuration needed is a triply-addressed machine with 9 bit operation codes and 12 bit addresses. In addition, the authors propose a mathematical address consisting of 19 bits. Of these, 7 are allotted for a memory pack, 5 for a memory "page", and 7 for a code number. In operational memory, scales are stored in successive cells containing all indices of mathematical addresses which can be used for computation. Each scale has 32 bits numbered from 0 to 31, each of which corresponds to a page from a memory pack. From the scale the address of the given code is found in operational memory, or, if the memory page is not in the

Card 1/2

ACCESSION NR: AP4045720

operational part, control is transferred to a special program which reserves memory space for the corresponding page which is read in from outer memory. The sequential steps in processing a dynamic memory transfer are outlined in detail, including bit contents and definitions. The function of an administrative (monitor) program in dynamic memory allocation is discussed, along with the specifications of such a program. Orig. art. has 3 figures.

TITLE: Toxicity of the chlororganic herbicide sodium trichloroacetate

SOURCE: Gigiyena i sanitariya, no. 1, 1967, 48-52

TOPIC TAGS: toxicity, animal, pathology, acute intoxication, herbicide, chlororganic herbicide, sodium trichloroacetate

ABSTRACT: An investigation was made of sodium trichloroacetate toxicity for various animals. To induce acute intoxication with large doses of this compound, a total of 333 animals were tested. The lethal dose₅₀ (LD₅₀) for rats, rabbits and guinea pigs was 6 gr per kg body weight. For mice and cats the respective doses were 5 and 4 gr per kg. body weight, respectively. Chronic intoxication was induced with daily doses of 1 to 0.5 gr of sodium trichloroacetate for a 7 mo period. Pathological examination of animals indicated that only cardiovascular system, stomach, and to a lesser extent liver, kidneys and adrenals showed some

UDC: 615.778.38-099

Title : New Method for X-ray Structural Investigation of Radioactive Material

Orig Pub : Zh. tekhn. fiziki, 1956, 26, No 4, 870-873

Abstract : A setup for the investigation of highly radioactive materials was constructed around a Norelco type ionization x-ray spectrometer. A beam of x-rays is incident on a flat specimen. The diffraction ray, passing through the entrance slit, is reflected by a monochromator and is recorded with a counter. The kinematic setup permits automatic recording of the x-ray pattern with a potentiometer over a range of Vul'f-Bragg angles from 0° to 45° , or else to plot the diffraction lines from the number of pulses counted by a mechanical counter. Lead shields 90 cm thick protect the counter from the radioactive radiation of the specimen. The monochromator used was a rock salt crystal, bent plastically by Johann's method. If the specimen is highly active it is possible to use a second order reflection from the monochromator, thus resulting in an increase of the shielding. If the shielding is reinforced, the setup
