Title: "The Spectral Distribution of Raindrops from Cumulus Clouds."

Source: Budapest, Idojárás, Vol. 65, No 2, March-April 1961, pp 32-33.

Abstract: Between March and July 1960, measurements were made in the Aerological Observatory (Aerologial Observatorium) of Budapest for the spectral distribution of raindrops from cumulus clouds, with the help of the well-proved hydrophotographic-micrometeorological method. Similarly to our earlier measurements, the distribution by drop diameters was calculated in every case for the number of raindrops (N) falling on a unit surface during a unit of time, for the number of raindrops (N) in a unit of volume, and for the water content (w) in grams. Seven characteristic cases were selected from our measurements for the demonstration of spectral distributions. Table I shows the number of drops per cubic meter by the intervals between drop diameters (in mm). The distributions were grouped according to rain intensities. On the basis of Table I, the maximum frequency, mode, and maximum drop

AUTHOR: Messaros, ErnoTITLE: Identification of calcium particles in the atmosphereSOURCE: *Studia geophysica et geodactica*, v.9, no. 1, 1965, 68-74

TOPIC TAGS: calcium, atmospheric sampling, rain

Abstract [English article, author's Russian summary]: Using the microanalytical method, measurements were made to determine the size and number of atmospheric nuclei containing water-soluble calcium. In some instances the concentration of particles of insoluble calcium carbonate was also determined, by exposing the sample to vapors of hydrochloric acid. The concentration of water-soluble and insoluble calcium is tabulated and shown in diagrams. On average the mass of the calcium particles ranges from 0.01 to 1.0 microgram per cubic meter. The obtained values indicate that the amount of calcium in rain water cannot be explained merely as the capture of water-soluble calcium by raindrops. It may be concluded that the captured insoluble calcium becomes completely soluble in rainwater. Orig. art. has 1 figure, 3 formulas, 4 graphs, and 1 table.

TITLE: Relations between the quantity and chemical composition of precipitation water

SOURCE: Idojaras, v. 69, no. 4-5, 1965, 257-262

TOPIC TAGS: atmospheric precipitation, ion concentration, chemical composition, electric conduction, atmospheric water

ABSTRACT: The quantity of precipitation during the summer and the winter in Budapest in 1964 was correlated with the content of chloride ion, sulfate ion, nitrate ion, ammonium ion, and calcium, and such electrical characteristics as pH and electrical conductivity in the precipitate. The data obtained were presented and discussed. The significance of the relationships observed, such as the air-scrubbing ability of the various precipitates, was discussed in terms of overall chemical and physical phenomena, such as rainout and washout. Orig. art. has: 9 figures and 1 table.

TITLE: Extent of the air-polluting effect of Budapest

SOURCE: Idojaras, v. 69, no. 4-5, 1965, 291-293

TOPIC TAGS: air pollution, aerosol

ABSTRACT: Aerosol-concentration determinations were conducted at the Aerological Observatory (Aerologial obszervatorium) in Pestlorinc, at Eotvos Lorand Scientific University (Eotvos Lorand Tudomanyegyetem) in Budapest, and at the National Institute of Hygiene (Orszagos Kozegeszssegugyi Intezet) [location not given] during the heating seasons of 1962, 1963, and 1964. The results were compared to those obtained at uninhabited areas between Miskolc and Hatvan. It was found that the extent of the pollution caused by the heating extended to an area of 20-25 kilometers around the center of Budapest. Orig. art. has: 1 table. [JPRS]

TITLE: Role of chloride particles of maritime and continental origin in the formation of the chloride content of the precipitation. This paper was presented at the symposium on cloud physics organized by the Hungarian Meteorological Society in Budapest on 8-10 Sep 65.

SOURCE: Idojaras, no. 1, 1966, 10-16

TOPIC TAGS: atmospheric precipitation, gas adsorption, chloride; atmospheric evaporation

ABSTRACT: By knowing the mass concentration of chloride particles of maritime and continental origin, as well as the vertical variation of its size distribution with some additional assumptions, it is possible to estimate the chloride content of raindrops of different sizes. According to such estimations carried out for the summer period, the average chloride content of the rain is 0.2 ug./l. The deviation between the calculated and measured values ranges within one order of magnitude; it can be interpreted as a result of the evaporation of raindrops and of the adsorption of gaseous chlorine. Orig. art. has: 3 figures, 5 formulas, and 4 tables. (Orig. art. in Russian.) [JPRS]

"Data Concerning the Problem of Residuum Formed at the Place of Pulmonary Abscess After Treatment with an Inhibitor Compound."

Budapest, Orvosi Hetilap, Vol 107, No 40, 2 Oct 66, pages 1889-1892.

Abstract: [Authors' Hungarian summary] The fate of residua formed at the site of pulmonary abscess was studied in 90 patients treated for the disease by inhibitor compounds between 1952-59. Residuum was diagnosed in a total of 64 cases. The patients were under medical control for 6-12 years after their discharge and 56 patients participated in the present study. In these, cicatrized residuum and residual cavity were distinguished from a radiological aspect. Among the patients discharged with a residual cavity, resection was performed in 5 because of hemorrhage and in 3 because of recurrence. The other patients were free of symptoms several years later. 3 Hungarian, 28 Western references.

ORG: Institute of Physiology, Medical University of Budapest (Budapesti Orvostudomanyi Egyetem, Biellini Intezet)TITLE: New data relating to reticular control of cerebral cortical evoked potentials [This paper was presented at the 29th Meeting of the Hungarian Physiological Society held in Szeged from 2 to 4 July, 1964.]

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 26, Supplement, 1965, 9-10

TOPIC TAGS: brain, cat, cerebral cortex, drug effect, tranquilizer, neurophysiology, pharmacology

ABSTRACT: It was previously shown in acute experiments on cats that stimulation of the brain stem reticular formation for varied lengths of time evoked different changes in the configuration of the cerebral cortical responses to the stimulation of the sciatic and splanchnic nerves. In the present study an attempt was made to determine how these changes in configuration would be modified by blocking the activity of the brain stem reticular formation with chlorpromazine. It was shown that, in response to

Card 1/2

L 15519-66

ACC NR: AT6007376

the i.v. administration of 5 mg/kg chlorpromazine, the amplitude of both phases of the cerebral cortical evoked potentials decreased. At the same time, the changes in amplitude in response to stimulation of the reticular formation for different lengths of time were the same in character and degree as without chlorpromazine. This confirms the assumption that the impulses to the reticular formation are eliminated by chlorpromazine while the diffuse system of the brain stem remains capable of functioning under the effect of the drug. The decrease in amplitude of the evoked potentials is presumably due to a diminution in reticular formation activity. [JPRS]

TITLE: Effect of stimuli applied to the reticular formation of the brain stem on the cortical evoked potentials in the course of ontogenesis 22

SOURCE: Academia scientiarum hungaricae. Acta physiologica, v. 27, no. 3, 1965, 237-246

TOPIC TAGS: cat, brain, autonomic nervous system, biologic aging

ABSTRACT: Cortical potentials, evoked in young cats of different ages by the stimulation of visceral (splanchnic) and somatic (sciatic) nerves, have been studied in different activity phases of the non-specific system of the brain stem. Evoked cortical potentials could be registered in all of four age groups. The responses varied according to age. Latency of the cortical response was, in all age groups, longer after splanchnic than after sciatic stimulation and longest in the 1 month age group, i.e., longer than in either older or younger animals. Noteworthy changes in the cortical potentials were obtained on stimulation of the brain stem reticular formation whether the potential had been evoked viscerally or somatically. These changes were more pronounced when the splanchnic nerve was stimulated. The non-specific effect

was particularly marked in the 1 month age group. Cortical localization is not sufficiently circumscribed in young kittens, so that responses could be recorded from a wide cortical area in such animals. Orig. art. has: 7 figures.

"Differential Inhibition of Interoceptive Conditioned Arousal."

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol XXIII, No 4, 1963, pages 347-353.

Abstract: [English article, authors' English summary] Differential inhibition of the conditioned interoceptive arousal reaction has been studied in dogs with double intestinal or ureteral fistula. It has been found that, if the mechanical stimulation of the wall of one intestinal segment is associated with a reticular stimulus causing arousal, and the stimulation of the other intestinal segment is not followed by reinforcement, a differentiation of the conditioned arousal develops. No differential inhibition develops to the stretching of the two renal pelvis. On the basis of the evidence gathered, conclusions are drawn as to the central representation of non-symmetrical and symmetrical visceral afferentation. 2 Western, 6 Eastern European references.

ABSTRACT: The effect of stimulation of the reticular formation for various lengths
of time on the cerebral cortical evoked potentials of splanchnic and sciatic origin
has been investigated on 37 unanesthetized cats paralyzed with gallamine triethiodide.
On increasing the non-specific stimulation, the evoked potentials of splanchnic
origin were found to be gradually blocked after an initial increase, whereas the
sciatic nerve responses were increasingly facilitated. Orig. art. has: 4 figures.

TITLE: Attempt at the determination of the etiology of angina after smallpox vaccination

SOURCE: Przeglad epidemiologiczny, v. 19, no. 3, 1965, 331-334

TOPIC TAGS: disease incidence, virus disease, bacteriology, immunization

ABSTRACT: Virological and bacteriologic tests of one hundred children vaccinated against smallpox for the first time revealed that throat inflammation (swelling of mucous membranes, transparency of vesicles) occurs in 70 percent of the cases, usually 5-7 days after vaccination. In some cases the pattern of the disease is more serious (pseudodiphtherial angina) and appears 10-13 days after vaccination. Since no trace of vaccinia virus was found in inoculated chick embryos, it is assumed that the presence of the virus in blood at the time of vaccination may have a delayed allergizing effect. The authors thank Dr. M. Stopnicka, Dr. Z. Bilinska, Dr. W. Petragowska, and Dr. H. Karwowska for making possible the research on the grounds of the Children and Infant's home.

SCURCE: Przeglad epidemiologiczny, v. 19 no. 3, 1965, 335-346
TOPIC TAGS: bacteriology, cytology, virus disease, bacterial antigen, diagnostic
medicine, epidemiology
ABSTRACT: Samples from smallpox suspects were tested during the epidemic in
Poland in 1963. Chorioallantoic membrane of chick embryos was used for iso-
lation. Hyperplastic foci occurred as a result of infecting HeLa cells with
small doses of the identified virus. The phenomenon is described in the li-
terature as the differentiating agent between variola and vaccinia virus.
Serum hemagglutinin levels obtained by the authors correspond to the results of
McCarthy, Downie, Elizberg and Marennikowa. A high correlation existed between
serum antigen levels and the clinical pattern of the disease. Antihemagglutinin
levels corroborate the diagnosis of variola. In the event of clinical and
bacteriological negative findings, this may serve as a basic diagnostic
method. The authors thank Docent, Doctor T. Sporzynski for valuable comments and
discussion of the results. Orig. art. has: 9 figures and 3 tables. [JPRS]
