Praktikum po dozimetricheskim priboram dlya rentgenovskogo i yadernykh izlucheniy (Manual on Dosimetric Instruments for X-Ray and Atomic Radiation). Moscow, Medgiz, 1961. 182 p. 7000 copies printed.

Ed. (Title Page): A. N. Krongauz; Ed.: V. F. Smirnov; Tech. Ed.: N. I. Lyudkovskaya.

PURPOSE: This book is intended for physicians, medical students, and laboratory personnel working with radioactive substances.

COVERAGE: The book contains descriptions and technical characteristics of various dosimetric instruments produced in the USSR and used in medical practice. It also contains a series of practical exercises to be carried out in the study of nuclear physics and dosimetry in medical school. No personalities are mentioned. There

Abstract : At the Spawning and Rearing Farm "Batrachok" (in the volga River delta) superphosphate was applied twice for 10 days before filling the lake and after the inlet of the melted water; this increased the productivity of the fish on the farm by 35.8 kilograms per hectare, or by 22% over the average fish production of the

AUTHORS: Margulis, Ye. V., Getskin, L. S., Mil'skaya, N. S.

TITLE: Pressure of the saturated SeO_2 vapor

PERIODICAL: Zhurnal neorganicheskoy khimii, v. 7, no. 4, 1962, 729-731

TEXT: The pressure of the saturated SeO_2 vapor was measured in the range from 130 to 231.5°C by means of the saturation method for the purpose of checking the divergent literature data (Fig. 2). Dried SeO_2 is present in the vertical, U-shaped saturator (8) which is kept at constant temperature in a thermostate filled with a corresponding glycerin + water mixture. The temperature of the SeO_2 charge controlled by means of a Pt-resistance thermometer was kept constant within $\pm$0.5°C. The condensing tube connected with the saturator via a mercury seal was cooled by melting ice. The water-vapor saturated carrier gas (O_2 for preventing SeO_2 reduction) escaping from the condensing tube, reaches a gasometer which keeps the gas pressure constant with barometric pressure with an accuracy of 0.076 mm Hg. In the condensate of the SeO_2 vapor dissolved in water, Se was colorimetrically determined, and the pressure of the saturated SeO_2 vapor

Card 1/3

Pressure of the saturated ...

was calculated according to: $p_s = P_s/\left[M \cdot V(P_w - p_w)/gTR + 1\right] = P_s/K$, where p_s is the pressure of the saturated vapor of the substance at the temperature of the saturator in mm Hg; P_s is the total pressure in the saturator in mm Hg, M is the molecular weight of the evaporated substance, V is the volume of the gas passed through the saturator in liter, P_w is the total pressure in the water gasometer, in mm Hg, T is the gas temperature in the water gasometer, in ^oK, R is the gas constant: 62.361 mm Hg/^oK, and g is the weight in g of the substance evaporated during the experiment. Between 20 and 300°C no polymorphous conversion was detected for SeO_2. The pressure of the saturated SeO_2 vapor was 0.017 mm Hg at 130°C and 8.13 mm Hg at 231.5°C. The following temperature dependence of the saturated-vapor pressure was ascertained: $\log p = 10.7265 - 4936.2/T$. The heat of evaporation of SeO_2 is $\Delta H = 22.583$ kcal/mole. There are 2 figures and 1 table.

PERIODICAL: Referativnyy zhurnal, Khimiya, no. 5, 1963, 198, abstract 5Zh115 (Tr. Donetsk. politekhn.in-ta, 1961, v. 53, 91-93)

TEXT: A series of refinements were conducted in the already known method (see Smith, L, Synthesis in Organic Preparations, Moscow, Publishing House of Foreign Literature, v. 2, 1949, 253) of methylating xylol (I) with the aid of CH_3Cl to the point of formation of pentamethyl- and hexamethyl benzene. Methylation of I is conducted to formation of mesitylene, which is isolated and subjected to further methylation, which shortens the duration of the reaction from 120 to 11-13 hours. Powdered $AlCl_3$ is used. The impure synthesis product is freed from the catalyst by means of careful addition of water, the purification being achieved by co-distillation with ethylene glycol. Some changes in the apparatus for conducting these syntheses were proposed. M. Ryashentseva.

Title : Corn Extract as a Raw Material in the Production of Antibiotics

Orig Pub : Rev. chim., 1957, 8, No 1, 54-55

Abstract : Corn extract derived in the manufacture of corn starch is an excellent culture medium for various fungi and is suitable for the manufacture of antibiotics. Quality of the extracts is dependent on the ratio of total nitrogen (I) to carbohydrates (II) and to lactic acid (III). With a high content of III and a low content of II, the decomposition of amines is facilitated and the decomposition products are easily assimilated by the microorganisms.

ABSTRACT: Guinea pigs were sensitized with horse serum and different serum fractions were injected to induce shock. It was found that beta-globulin has the most pronounced anaphylactogenic effect. It was also shown that in the hypothermic state guinea pigs sensitized with horse serum become desensitized to the serum fractions with a weak anaphylactogenic effect but not to those with a strong one. "Antigen Distribution in the Tissue of Dogs in Anaphylactic Shock."

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Vol XXX, No 1, 1966, pages 99-105.

Abstract: [English article, authors' English summary modified] Anaphylactic shock was induced in dogs by means of ^{51}Cr labelled egg albumin. The control animals received ^{51}Cr labelled egg albumin but no shock was induced in them. In the controls, activity was highest in the blood followed, in decreasing order, by that in the liver, kidney, spleen, lung, urine, heart, intestine, skeletal muscles and brain. In the test animals, the activity in the blood and lungs was higher than that in the controls if the second injection was into the saphenous vein; after intraportal injection, the highest activity was measured in the liver. The disappearance of mast cells of the animals in shock was 70 per cent from the liver, 39 per cent from the lungs and 30 per cent from the ear. 4 Hungarian, 11 Western references. "Formation of an Intravascular Precipitation in the Anaphylactic Shock of Guinea Pigs."

Budapest, Kiserletes Orvostudomany, Vol XIX, No 1, Jan 67, pages 1-6.

Abstract: [Authors' German summary] Passive Arthus and antigen-antibody-complex reactions as well as passive cutaneous anaphylaxis was produced in alloxan-diabetic rabbits and mice. It was established that the development of this skin reaction is decreased in severity by the presence of diabetes. A hyperglycemia produced by the administration of glucose has a similar inhibitory effect. It is probable that the inhibition of histamine liberation by the high sugar level and the formation of granulation tissue is responsible for the decrease in the intensity of the skin reaction. 7 Hungarian, 5 Western references. TITLE: The possible use of glass-plastics as reinforcement for concrete structures

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 3, 1962, 393-394, abstract 3K370 (Izv. vyssh. uchebn. zavedeniy. Str-vo i arkhitekt., no. 3, 1961, 25-32)

TEXT: Results are given of experimental investigations into the determination of concrete strength, deformations, anchorage and bond for glass-plastic reinforcing bars. The resistance to cracking and rigidity of concrete structures reinforced with glass-plastic material is also considered. The ultimate tensile strength was determined, as well as the following: elastic modulus and the character of time growth of residual deformations in reinforcement. The experiments were conducted in different media (air, water, concentrated solution of $Ca(OH)_2$. The use of glass plastics as pre-stressed reinforcement by good prospects, since rigidity and resistance to cracks of unstressed glass plastic reinforced

TITLE: Experimental investigation of the properties of a plastobeton based on FA monomer

CITED SOURCE: Sb. Eksperim. teor. issled. zhelezobeton. konstruktsiy. M., Gosstroyizdat, 1963, 15-29

TOPIC TAGS: concrete, organomineral concrete, plastobeton, furfural acetone based concrete, reinforced concrete, armoplastobeton, concrete physical property, cement

ABSTRACT: The authors investigated the properties of an organomineral concrete, plastobeton (PB), which consists of a furfural-acetone (FA) monomer with a mineral filler. A PB of the following composition was prepared (wt %); sand 83.2, FA monomer 12, benzenesulfonic acid 4.8 and acetone 10% of the weight of benzenesulfonic acid. In the investigation of armoplastobeton (APB) properties, smooth 3.2 and 8 mm steel wire was used as the reinforcing element. The strength and deformation characteristics of cement-based materials were investigated in a parallel study.

Card 1/2

ACCESSION NR: AR4033716

Mechanical tests were carried out on cubic and prismatic strength, compression and elongation deformation, and notch toughness as well as studies of PB-to-framework adhesion, PB water and petroleum impermeability, corrosive action on the framework, frost, atmosphere and sea water stability and PB aging. It has been found that PB is superior to cement-based materials in many physical-mechanical characteristics. The axial elongation and bending strength of PB is about twice as high as that of cement. PB possesses enhanced notch toughness and good framework adhesion. APBs possess high crack resistance (approximately 1.5-2.5 times as high as cement). The use of PB is, however, limited by lower APB rigidity, lack of stability to benzine, a tendency toward aging and difficult setting of the material into molds.

Technology of reinforced concrete shipbuilding (Tekhnologiya zhelezobetonnogo sudostroyeniya) Leningrad, Izd-vo "Sudostroyeniye", 65. 0347 p. illus., biblio. 2,500 copies printed.

TOPIC TAGS: shipbuilding engineering, concrete, reinforced concrete, construction material

PURPOSE AND COVERAGE: This book presents the newest developments in the technology of constructing reinforced concrete ships. Special note is made of the methods of producing reinforced concrete ship structures, shipyard construction of the ship hulls, and the use of new high-efficiency materials. Descriptions are made of the technology and organization of mechanical assemblying, insulation work, finishing and equipment for installing reinforced concrete ships. Data is given on the main works of shipyard reinforced concrete shipbuilding, its equipment, and technical and economic aspects of building these ships. A large part of the book deals with mechanization of production processes of building the hulls. The book is recommended for technical engineers in the planning, construction and scientific study organizations of the shipbuilding industry, and for engineers in shipyard reinforced concrete shipbuilding. It can be useful for students of shipbuilding institutes and departments.
