Abstract: xanthine and guanine; it increased in the presence of adenine and xanthine. By successive increase in concentration of I in the presence of indicated anti-sulfamide metabolites (AM) the resistance of *S. typhimurium* to I increased 15-20 fold, which was not observed in the absence of AM. About 50% of the resistance was further preserved even without AM. In the authors' opinion, the development of resistance is connected with a gradual adaptation of the microorganisms to changing environmental conditions, with a subsequent selection, and is not the result of simple selection of pre-existing resistant variants. With the presence in the

TITLE: Intermediate stage in recording for prospecting geophysics

SOURCE: Razvedochnaya geofizika, no. 14, 1966, 104-110

TOPIC TAGS: geophysics, telemetry system, geophysic instrument, magnetic recording, prospecting geophysics

ABSTRACT: The possibilities were investigated for intermediate recording of prospecting geophysics data using an analog form magnetic recording with frequency modulation, pulse width modulation and three bore-hole multichannel telemetry systems of electric logging on a single cable. The telemetry systems mentioned were: frequency modulation telemetric system developed by A. G. Barminskiy, the "Azinestekhim" telemetric system, and the OKS-VIM (single logging cable with PWM) developed by O. V. Rudnev. The recording was made on a single-channel magnetic recorder with a 30 cps to 30 Kc transmission band, based on the MEZ-15

Card 1 / 2

ACC NR: AT7003203

radiobroadcasting magnetophone. It was found that the conservation of data of geophysical investigations of boreholes can be made on a magnetic recorder in an analog form with ordinary magnetophone-type equipment. The accuracy of the above-mentioned telemetry systems proved satisfactory. The method used was found to be more practical with a large number of channels and a moderate dynamic measurement range. [GC]

REF SOURCE: Sb. Meteorn. rasprostr. radiovoln., no. 2. Kazan', Kazansk. un-t, 1964,
141-145

TOPIC TAGS: photoelectric method, photoelectric tracking, graphic data processing,
meteor tracking, meteor detection, radar meteor observation

TRANSLATION: An FEP photoelectric converter for converting graphic records of processes into corresponding electric voltages is described. The voltages can be subsequently fed into various analyzers and, through a small interface, into a VM punch. The FEP is designed on the basis of sweep signal and is intended for processing meteor observations. The recordings may be made on a continuously moving 35 mm movie film, photographic film, photographic plates, or tracing paper with dimensions not exceeding 80 x 60 mm. The FEP was designed for automatic processing of meteor radar echo observation. 3 figures. V. L.

Abstract : By means of preparations and roentgenography a study was made on 40 extremities of children and fetuses from the 6th month of intrauterine life on, of the sources of blood supply and innervation of the muscles as well as the topography of sites where arteries and nerves enter the muscles. Two basic forms of entry of arteries and nerves into the muscles were established. The segmental form is characterized by a successive entry of arterial and nerve branches along the entire length of the muscle (posterior

Title: Calculation of the base pressure on a body of revolution in a supersonic flow

PERIODICAL Akademiya nauk SSSR, Izvestiya, Otdeleniye tekhnicheskikh nauk, Mekhanika i mashinostroyeniye, 1961, No.3, pp.32-39

TEXT The flow can be divided into six zones:
1 - the flow ahead of the base up to the first characteristic from the base; 2 - the expansion flow round the edge of the base;
2 - the region of mixing at constant static pressure in the compressible boundary layer on the edge of the stagnation zone;
3 - isentropic flow in the external stream adjacent to the region of mixing; 4 - the region of increased pressure adjacent to the end of the stagnation zone; 5 - the stagnation zone.
It is assumed that in regions 1 and 3 the fluid is ideal and compressible & that the parameters can be determined by the method of characteristics. It is further assumed that narrowing of the flow at the end of the stagnation zone takes place isentropically. From the boundary layer equations, the pressure across the region

2967

5/17/61/000/003/006/016
E031/E435

The calculation of the base .

of mixing is constant. Two systems of coordinates are introduced: the XY system coinciding with the inner boundary of the conjugate points of external flow, and the xy system in the real boundary layer displaced from the XY system by a small quantity $y^*(x)$ in the direction of the y axis. This displacement is determined by applying the law of conservation of momentum at two sections of the flow, one of these being at the beginning of the region of mixing and the other an arbitrary distance x from the first, and eliminating the density. The stream line in the boundary layer separating the fluid in the stagnation zone from that in the external flow can be determined by equating the rates of flow at the two sections. The velocity profile in the region of mixing can be determined from the equations of motion and continuity by applying Mangler's transformation, which reduces the equations to a form corresponding to that for a plane boundary layer. After linearization and with the aid of the assumption that the effect of the initial velocity profile in the boundary layer in the region of mixing can be ignored, the solution of the equation of motion can easily be expressed in terms of the error function. The basic difficulty in analysing the flow in the region where the

X

Car 1 2/3

S/179/61/000/003/006/016
E031/E437

... at the base ...

The problem is that of determining the angle through which the wake turns. This could be determined by knowing the streamwise velocities of the wake and it is argued that the flow will turn so that the radius is half that of the base. Knowing the angle of turn in the region of mixing the streamline can be followed and which separates the fluid whose kinetic energy is sufficient to carry it into the region of increased pressure from the fluid whose kinetic energy is insufficient to overcome the base wake. The steps in using the results derived for determining the base pressure are given. A simplification either in the form of the plane of calculation or to obtain an approximate solution is indicated briefly. There are 3 figures and 10 references. 3 Soviet and 7 non-Soviet. modulus, sound propagation, acoustic speed
ABSTRACT: In view of the lack of experimental data on elastic proper-
ties of solidified gases, the authors have measured the temperature
variation of the elastic constants of solidified methane, using for
this purpose a dynamic method based on the measurement of the propa-
gation velocity of longitudinal and transverse ultrasound waves. The
test procedure was a modification of a pulsed method first described
by N. I. Brazhnikov (Pribory dlya izmereniya akusticheskikh 1 2

opticheskikh velichin, No. 4, 1961) employed by the authors earlier to determine the elastic moduli of polycrystalline ammonia (UFZh v. 10, 1251, 1965). A feature of this modified pulse method is the use of an additional acoustic line filled with a standard liquid, in which the propagation velocity of sound is known with sufficiently high accuracy (Fig. 1). The measurements were made at 1 Mcs and in two temperature intervals, 77.4 -- 63.5 and 21.2 -- 14.4K. The tests yielded the adiabatic compressibility and the Poisson coefficient. The measurement technique and the sample preparation procedure are described in detail. In the 21 -- 77K range the compressibility increases with increasing temperature, from 0.48 to $0.9 \times 10^{-11} \text{ cm}^2/\text{dyne}$; the Poisson coefficient is 0.30. A phase transition is observed at 20.4K. The Debye temperatures of the high-temperature and low-temperature phases are estimated to be 120 and 137K, respectively. Some of the difficulties still to be overcome in future measurements are briefly discussed. The author thanks A. V. Nazarenko for careful preparation of the measurement line. Orig. art. has: 2 figures, 4 formulas, and 1 table.

TITLE: Protective action of acridine orange against ultraviolet irradiation of DNA-infected bacteriophage 1 sub Phi 7

SOURCE: AN SSSR. Doklady*, v. 155, no. 4, 1964, 937-939

TOPIC TAGS: bacteria destroyer, bacteriophage, phage, bacteriolytic agent, acridine orange, DNA, desoxyribonucleic acid, deoxyribonucleic acid, biochemical research, physiological research, TNA, spheroplast

ABSTRACT: In the interaction of the basic dye acridine orange (AO) with DNA two complexes are formed: complex I, probably consisting of AO dimers or higher aggregates and complex II is an AO monomer. Complex I is mostly formed with single-chain DNA and RNA, while complex II is formed with native double-chain DNA. The purpose of the present work was to find whether AO can be used as protective substance against inactivation of infectious DNA by UV radiation. In the tests, DNA of the intestinal phage 1 ϕ 7 was used. DNA isolated from 1 ϕ 7 is infectious for spheroplast bacteria. DNA separation was done according to the phenolic

Card 1/3

ACCESSION NR: AP4030793

method. Spheroplasts were prepared from a broth culture of E.coli C. An elaborate test showed that dyeing of infectious DNA with AO in a $5 \cdot 10^{-7}$ M concentration caused practically no screening of UV light. The same test was repeated with $1 \cdot 10^{-7}$ bacterio. phage. AO dye has no effect on the whole phage (DNA + albumin skin) since it does not penetrate through the albumin skin. Neither does UV radiation. With increased AO concentrations, the quanta input of lethal UV action decreases ($5 \cdot 10^{-7} = 1.6x$; $2.5 \cdot 10^{-6} = 2.85x$; $5 \cdot 10^{-5} = 4.8x$). The tests showed that in a DNA solution dyed with AO and irradiated with UV light (of the nucleic acid absorption spectrum), the dye protects DNA from inactivation by the UV quanta. This means an effective energy migration from the DNA base to the dye with subsequent light output or heat conversion. Orig. art. has: 1 figure, no formulas, no tables.

TITLE: Ribbed surface for tubular and plate heat exchangers. Class 46, No. 173546

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 15, 1965, 125-126

TOPIC TAGS: heat exchanger, heat diffusion, heat exchange panel

ABSTRACT: This Author Certificate presents a ribbed surface for tubular and plate heat exchangers containing parallel rows of tubes or plates (see Fig. 1 on the Enclosure). To decrease the area of its frontal section and to increase its coefficient of heat exchange, the ribs on the adjacent rows of tubes or plates are axially shifted in respect to one another, while the rows of tubes or plates are separated by deflectors. The tubes or plates and the deflectors form defusers, convectors, and gas ducts. The ribs may be longitudinal (smooth or corrugated), or they may be made of wires of desired diameters. The tubes may be flattened. Orig. art. has: 1 figure.

TITLE: 68.5 cm sector-focused cyclotron //

SOURCE: Atomnaya energiya, v. 20, no. 5, 1967, 422-430

TOPIC TAGS: cyclotron, deuteron, proton

ABSTRACT: A sector-focusing cyclotron that can deliver protons of 7.5 to 100 Mev and deuterons of 0.5 to 4.0 Mev is described. The acceleration of molecular H₂⁺ ions underscores the essential role of the process of proton dissociation. Under certain conditions intrinsic to the sector-focusing cyclotron where the ions achieve several hundred revolutions, this process can interfere with obtaining the intensity of the ion beam at finite energies, if the vacuum in the accelerator chamber is less than 1.10⁻⁵ mm Hg cm⁻³.
