ACC NR: AT6025307

system of equations under these conditions, using the EMU-10 analog computer, are presented. The plots show the nominal heating against nominal coolant flow, the power, average coolant temperature, reactor-outlet temperature, and reactivity against time for different rates of flow, the maximum deviation of the coolant temperature from nominal against the nominal flow, the power variation during self regulation at different rates of flow, and the maximum deviation of power against coolant flow. A diagram of the system and the differential equations solved with a computer are given in a companion paper in the same source (p. 82, Acc. Nr. AT6025309). The results show that an increase in the regular flow increases the speed of reactor shutdown cooling, reduces the deviation of the temperature from nominal, reduces the transient times, and reduces the maximum power deviation. It follows from the results that the main parameters of a nuclear power system with water-water non-boiling reactor (deviations of the power and temperature under nonstationary conditions) and the required efficiency of the control units under emergency conditions depend significantly on the nominal flow of coolant in the reactor. Orig. art. has: 6 figures.

TITLE: Influence of the temperature coefficient of reactivity on the character of the transient and emergency modes in a nuclear power station

SOURCE: Moscow. Inzhenerno-fizicheskiy institut. Upravleniye yadernymi energeticheskimi ustanovkami (Control of nuclear power plants), no. 1. Moscow, Atomizdat, 1966, 82-91

TOPIC TAGS: nuclear reactor power, reactor transient, nuclear safety, nuclear reactor coolant, temperature dependence, nuclear reactor control, water cooled reactor/ EMU analog computer

ABSTRACT: This is a companion to another paper in this same source (p. 65, Acc. Nr. AT6025307) dealing with the influence of the coolant flow on the transients in a nuclear power station. The present article presents the main results of an investigation of the dependence of the transients on the negative temperature coefficient for a two-loop system with water-water heterogeneous reactor. The diagram of the system is shown in Fig. 1 together with the control elements. The authors have set up mathematical models of the reactor and of the steam generator, writing out the appropriate differential equations and solving them with the aid of an EMU-10 analog computer. The tests consisted of determining the response of the system to a jumplike increase in

TITLE: Simplest mathematical model for the investigation of the dynamics of water-water reactors in the self-regulation regime

SOURCE: Atomnaya energiya, v. 21, no. 5, 1966, 385"

TOPIC TAGS: nuclear reactor control, nuclear reactor characteristic, mathematic model, reactor neutron flux, kinetic equation

ABSTRACT: This is a summary of article no. 111/3464, submitted to the editor and filed but not published in full. A mathematical model is derived for the investigation of the stability of an isolated reactor in the self-regulation regime. This model can be used to investigate the dynamics of the reactor at sufficiently high frequencies, since the time constants characterizing the processes of heat exchange in the active zone are as a rule much smaller than the period of the circulation of the coolant. To prove the validity of this model, the influence of various factors is analyzed, namely the presence of spaces between the channels, the different number of groups of delayed neutrons, the lifetimes of the prompt neutrons, the distribution of the parameters along the length of the channel, the temperature effect of reactivity of the fuel, the nonlinearity of the kinetic equations, and the thermal inertia of the fuel element cladding. The effects of the different factors are discussed briefly individually. Orig. art. has: 1 formula.

TITLE: The dependence of the density of radiation defects in steel on the energy spectrum of neutrons

SOURCE: AN BSSR. Vestsii. Seryya fizika-tehnichnykh nauk, no. 4, 1966, 17-22.

TOPIC TAGS: neutron radiation, radiation damage, radiation effect, steel

ABSTRACT: An investigation was made of the effect of intermediate neutrons with energy  $E < 1$  Mev on the formation of radiation defects in iron. The investigation was made on the basis of Brinkman's model of peak shifts. Data were calculated which made it possible to evaluate defects (peak shifts) produced by neutrons with various energies in iron for three essentially different energy spectra of the incident neutron flux: 1) the fission spectrum, 2) the spectrum typical for the water-iron assembly, and 3) the spectrum whose maximum is shifted to the side of intermediate energies. The data show that, depending on the energy spectrum of the incident neutrons, intermediate neutrons can contribute substantially to the formation of defects. Neutrons with energies above 1 Mev contribute only slightly to the total defects. Even for the fission spectrum, only about two-thirds of the total defects are produced by neutrons with  $E > 1$  Mev. The use of an integral neutron flux

Card 1/2

UDC: none

ACC NR: AP7002876

with  $E > 1$  Mev for the characterization of the radiative stability of steel does not make it possible to draw conclusions about the permissible magnitude of the flux if the portion of neutrons with intermediate energies and their energy distribution are considerably different for the investigated spectrum and for the spectrum in which the experimental testing of samples was conducted. Orig. art. has: 4 formulas, 2 figures, and 2 tables. [W.A. 75]

TITLE: Contribution to the calculation of the Doppler temperature coefficient of reactivity of homogeneous reactors

SOURCE: Atomnaya energiya, v. 21, no. 5, 1966, 408-410

TOPIC TAGS: nuclear reactor characteristic, homogeneous nuclear reactor, temperature coefficient, nuclear resonance, approximate solution, computer calculation

ABSTRACT: The authors present a procedure for calculating the derivative of the resonance escape probability with respect to the temperature, or the derivative of the effective resonance integral with respect to temperature, for the case of a homogeneous reactor. The calculation is similar to that given by G. I. Marchuk (*Chislenyye metody rascheta yadernykh reaktorov* [Numerical Methods in the Design of Nuclear Reactors], M., Atomizdat, 1961) for a heterogeneous medium. A set of plots of the derivative of the self-screening factor with respect to temperature, which is evolved in these calculations, is included in the article. This set was obtained by solving the appropriate differential equation with an Ural-2 electronic computer. Orig. art. has: 10 formulas and 1 figure.

TITLE: Results of an investigation on aerostatic bearings<sup>11</sup>

PERIODICAL: Khimicheskoye mashinostroyeniye, no. 4, 1962, 16-29

TEXT: Factors affecting the performance of air bearing were studied by the Moskovskiy energeticheskiy institut (Moscow Power Engineering Institute) on a graduated bronze shaft in a steel bushing. A specially built experimental rig was used. It included an air feed system with a small air turbine, a group pressure gage simultaneously recording pressure in 48 spots in the air gap, an indexed dial indicator showing the vertical motions of the shaft, and an electronic rpm counter. A formula qualitatively expressing the factors affecting the bearing capacity was derived. Minimum possible gaps should be used in air bearings because this sharply

Card 1/12

Results of an investigation ...

increases the load capacity and reduces air consumption. Gaps narrower than 0.05 mm should not be used, and the specific load should be reduced if the eccentricity is too high and there is a danger of the shaft contacting the bushing; the use of an auxiliary air inlet system (Fig. 6) resulted in the load capacity being uniformly distributed along the shaft neck in the bushing; such a bushing can be used for shafts with a specific radial load greater than 0.2 Kg/cm<sup>2</sup> at 12000 rpm. In experiments with a thrust bearing, the specific load was varied from 0.5 to 1 Kg/cm<sup>2</sup> without impairing the performance, and it was found that the air should best be fed-in along the periphery of one half of the thrust plate diameter. Calculations and graphs, showing the dependence of the air pressure in the gap and its distribution on the initial air pressure and the point of air inlet and the dependence of the load capacity on the eccentricity and shaft rpm, are included. There are 7 figures.

Title : Resistance of Saccharolytic Inert Intestinal Group Bacteria to Antibiotics Without Preliminary Adaptation  
Orig Pub : Zh. mikrobiol., epidemiol. i immunobiologii, 1957, No 2, 72-77

Abstract : Strains of intestinal bacilli, Shiga's dysentery and the neutral, alkali-forming and acid-forming regenerated filtrable forms obtained from them, as well as alkali producers obtained directly from original cultures without filtration were utilized. Neutral and acid-forming regenerated filtrable forms are sensitive to streptomycin and penicillin to the same degree as are the original cultures. But all the alkali-forming cultures without a preliminary adaptation (contact with antibiotics) withstood hundreds of times stronger concentrations of these preparations. The same rule, though less expressed, was noted with respect to streptomycin. Regarding biomycin, reverse effects were observed -- the original

Title :A Biochemical and Physiological Investigation of Avitaminosis C in Connection with its Effect on Higher Nervous Activity.  
Orig. Pub. :Izv. Med. in-ti Bolg. AN, 1956, 13, 213--237  
Abstract : A gradual (over a period of 30--40 days) reduction in the levels of ascorbic acid in the blood, brain, heart, liver, and adrenals was observed in 17 guinea pigs from whose diet vitamin C had been excluded. In conjunction with the development of avitaminosis of several days duration, signs of increased cortical excitability were noted (shortening of the latent period of motor-alimentary conditioned reflexes, a decrease in the time taken to run to the food), which clearly preceded the clinical manifestations of disease. Subsequently there
